Family studies, particularly studies of twins, have shown both how reading difficulties are heritable and how environmental and behavioral factors influence their trajectories (Church et al., 2021). Molecular genetic studies, those aimed at identifying specific genes that predict or are associated with dyslexia, have identified many candidate genes, but no isolated region or specific sequence as of yet (Carrion-Castillo et al., 2013). Similarly, genetics research has been used to understand rates and likelihood of heritability as well as the possibility of early and accurate screening for predispositions toward reading difficulty, and a framework for studying epigenetic and protective factors that prevent reading difficulties (Erbeli et al., 2021).

We estimate that the concept of protective factors is likely to be the most generative area of research in the future because of its potential to contribute to understandings about early prevention of difficulties rather than intervention once difficulties have risen to the level of accurate identification in school settings. For example, researchers have recently investigated whether there is a protective or preventative roles for rhythm play, musical training and shared reading with 2 and 3 year old children with family histories of dyslexia (c.f. Cancer and Antonetti, 2022; see also: Huss et al., 2011). These and other similar studies could significantly reduce the percentage of students who experience difficulty learning to read. Investigations of the potential for prevention is especially important because, despite dramatic growth in technological capability and feasibility, as Church et al. (2021) have noted, "Neural and genetic studies do not prescribe how children should be taught to read, but these studies have underscored the critical role of early intervention and ongoing support" (p. 1).

Early identification

In the early 2020s, some researchers argue that early screening and intervention is paramount so that dyslexic children should be identified at an early age so as to not waste time as a severe reading disability develops (Snowling, 2013). Apps that can screen for

early signs of difficulty and tools identification in Kindergarten or PreK are currently under development (Perera et al., 2016). However, the research on such early identification is problematic when there has been little consensus on which developmental factors need to be assessed to identify a young child as a dyslexic. Without both an accepted and substantial research base identifying the common preliterate components that will be needed to ensure that those children helped by early intervention would have had much difficulty without the early intervention plus strong evidence that the condition of dyslexia has been avoided by those children who received the early intervention.

Scanlon et al. (2005), for instance, compared the progress struggling young readers made in reading acquisition under three conditions. First, one group of struggling readers received a text emphasis intervention. A second group received a phonological skills intervention and a third group was the control group of struggling readers who received neither intervention. The results showed that both treatment groups of children benefitted and both intervention groups outperformed the control group children on the word reading and the text comprehension assessments. However, the text emphasis children outperformed the phonological emphasis children on the word identification assessment. Thus, the group concluded,

It is clear that many children who were identified as poor readers at the beginning of first grade responded well to the instruction they received, regardless of the type of instruction provided.

Scanlon et al. (2005, p. 224).

While this study makes it clear that early intervention can benefit struggling young readers, it is unclear about the implications for children identified at age 5 as dyslexic. This because the Scanlon et al. (2005) study provided early intervention to all young children who were found to perform below average on a reading assessment, thus they had low-achieving young children, not necessarily a group of young children identified as dyslexic.

A major limitation in the research on dyslexic children replicates the Scanlon et al. (2005) study—using low achieving students but not necessarily students who had been identified as dyslexic students. A major reason for this limitation is the lack of a consensus on how one would identify a dyslexic child. However, with no universally accepted definition of what constitutes dyslexia, developing criteria for including/excluding a struggling reader from a pool of low-achieving students becomes an impossible task. We should not be surprised, then, that studies purporting to be studies of dyslexic children are too often more simply studies of struggling readers. With no consensus on a definition of dyslexia, one can never be sure whether the subjects in the study identified as dyslexic children were children who, in fact, met the three criteria listed by Tunmer and Greaney (2010) or not. The same holds for estimates of the number (or percentage of the population) of dyslexics in a class, a school, a school district, a state, or nationally.

Conclusions

Perhaps, in the future we will be able to be quite precise on what constitutes a dyslexic reader, other than difficulties with reading acquisition. We write this because, whether a condition called dyslexia exists as a natural, identifiable pattern of human variability or not, we know of too many children who struggle with reading acquisition and never truly become achieving readers. But for now, we will argue along the same lines as did Elliott and Grigorenko (2014) who noted that there were many definitions of dyslexia, that there exists no widespread consensus for an operational definition even where the term is defined, and no good reason to prefer one definition over another. Following them we would also argue that substituting the term reading difficulty for dyslexia makes sense to us in this time of limited agreement on the definition or the defining characteristics of dyslexia.

A constructivist lens of eye-tracking in special populations

A number of methods have been utilized as researchers, educators, and special service providers have sought to better understand how readers marshal resources to make sense of print. Among these, eye movement research has long been used in the investigation of how individuals visually sample print during reading and reading related activities (Paulson and Goodman, 1999). For well over 100 years, studies of eye movements have captivated researchers seeking to better conceptualize reading. With the advancement of technology, eye-tracking has become an increasingly accessible data source for research into the underlying cognitive processes associated with reading (Starr and Rayner, 2001; Rayner, 1978; Liwanag et al., 2017) and into the strategies readers employ while transacting with text (Krstić et al., 2018; Percle et al., 2020). The cost reductions resulting from technological innovation and accessibility of reliable equipment have enabled eye tracking research to consider reading behaviors in many different languages and cultures across the world (e.g., Hermena, 2021; Cop et al., 2017; Hung, 2021; Jian, 2015; Zang et al., 2011). Just as an audio recorder functions to capture verbal productions, in a parallel manner, eye-tracking systems are the recorder of eye movements. The researcher's contextualized expertise in understanding and interpreting behaviors is required to gain meaningful insights from the movements of the eye.

A variety of extensions of eye-tracking technologies for use with special populations assist in accomplishing multiple purposes. These applications are too expansive to address in a single entry. Therefore, we feel it appropriate to state the parameters through which we are conceptualizing the topic of eye tracking in special populations. Our consideration of special populations includes those individuals with a diagnosis of impairment sufficient to qualify for special services or individualized education plans. While we accept that many reject the deficit-based practice of assigning educational labels of impairment in favor of recognition of cognitive diversity, the literature in eye-tracking and the practices of educational professionals continue to largely operate under these frameworks. In this entry, we apply the theoretical lens of constructivism to interpret relevant findings in eye-tracking research with consideration to their differing applications. This enables us to apply a lens focused on meaning-making through which to consider the available literature.

We also confine our view of eye-tracking to studies engaged in illuminating the reading process. We purposefully avoid the literature focused on using technology to navigate assistive and augmentative communication devices. We also omit eye-tracking use as interventions, such as eye scan-path training or eye strengthening exercises. Instead, we focus on the literature informing the literacy process as it is realized in the lives of readers, including persons with special needs. The application of eye-tracking technology to the study of reading and the methodologies implemented in the investigation apply to all readers, regardless of efficiency. Generally

speaking, the patterns of eye movements in special populations largely match typically developing individuals of similar proficiency (Arya and Feathers, 2012; Nelson et al., 2008; Seassau and Bucci, 2013; Krstić et al., 2018). Because studies of reading apply to all readers, we can employ and integrate the findings of studies exclusive of special populations to this demographic.

Understanding eye-tracking—key components & terms

Several general terms are important for considering eye-tracking research, namely: fixation, saccade, and regression. Most eye-tracking systems capture the angle of the fovea, a flat part of the eye responsible for the greatest amount of visual acuity, as it relates to the stimuli or visual scene. This is done through a process of identifying the reflection of harmless infrared light off the cornea and the resulting variation in pupil diameter changes. Each of these points are translated into coordinates capable of being graphed. Through a calibration process, the point of gaze can be appended onto images of a scene and interpreted as locations upon which the individual looks. When a person's point of gaze remains within a narrowly defined window for a predetermined length of time, the person is said to have produced a fixation (Rayner, 1997).

Fixations are moments when the eye is relatively unmoving. It is during fixations when the processing of visual stimuli is believed to be possible. Understanding of fixations as times when the eye is relatively stable enough to process visual information comes from tachistoscopic studies of the length of time necessary for an individual to identify randomly presented print symbols (Huey, 1968). *Saccades* are the ballistic-like, rapid movements the eyes produce as they move from one fixation to the next. Attention to the duration of fixations or distance covered by saccades between fixations continues to be used by researchers making inferences about literacy processes. Additionally, in the eye-tracking research associated with reading, the term *regression* is used for eye movements produced when readers direct the eyes in any backwards movement (i.e., backwards in relation to the directionality of text within the language). These three terms essentially represent graphed coordinates in the same way the audio recordings represent sound wave productions. Their utility as research indices are dependent upon the investigator's interpretation of their significance. In social sciences of literacy, such interpretations are always driven by a theoretical stance (Geertz, 1996).

Presentation of eye-tracking data

As with all social science research, it is difficult to represent findings related to complex phenomena in written form. Doing so requires the researchers to present a static representation of dynamic processes. The challenge is to represent where the eye was, when it was there, and how the mind considered the visual input. Data is presented as a static image due to the limitations of print media. Because the goal is to represent the pattern of visual sampling, researchers present eye-tracking data several ways.

In Fig. 1, adapted from Paulson (2002), the reader's eye-movements are represented by a number positioned beneath the word on which the reader fixated. The numbers provide the sequence of fixations. For example, line 308 begins with the last three letters of the word "continued" ("ued showing right up until the day when, with a muffled"). The first fixation occurs at the beginning of the word "showing." Fixation two occurs in the middle of the next word, "right." Fixation three occurs at the end of the word "up," at which point the reader regresses back to the end of the word "showing." The reader then directs the eyes past the next two words, producing the fifth fixation on the word "until." In this style of data presentation, we can also visualize differences in length of fixation. Here, the duration of the fixation is conveyed directly below the numbered fixation. For example, fixation two (750 ms) was more than three times the length of fixation four (200 ms).

As technology has improved, so has the presentation of eye-movement data. Eye tracking systems now enable fixations to be superimposed onto a static image. Fig. 2 (an unpublished image from Nelson et al.'s 2008 study) shows a bilingual Spanish/English child with Down's Syndrome eye movements as she read from a page of a children's book. Presentations of eye data, like that found in this example, allow researchers to envision how the reader incorporated aspects of the illustration with the visually sampled text. The fixations are represented by blue dots and the sequence is demonstrated through numbering of dots and connected via red lines. Dot size conveys length of fixations, with larger dots reflecting longer fixation durations.

In Fig. 3, a similar method is used by Hung (2019). Here, fixations are represented by a red circle superimposed over the text. Durations are again represented by the size of the circle. Often, the choice of how to present the data is driven by the purpose of the study and the information the researcher is trying to convey. These decisions are always informed by the theoretical lens guiding the researcher's question(s).

Fig. 1 Representation of sequence and duration adopted from Paulson (2002).

Fig. 2 . Fixation sequence from unpublished image by Nelson et al. (2008).

Fig. 3 Representation of fixations from Hung (2019).

Overview of theory

Theories provide explanatory and guiding expectations of how and why a phenomenon occurs. Researchers use these theories to both determine how to investigate issues and interpret findings. While the underlying operations of the brain are consistent, the ways in which we understand those operations differ vastly depending upon theoretical orientation. Theory can serve to illuminate or obscure, as theoretical orientations shade every aspect of our understanding of neurological processes, including reading (Tracey and Morrow, 2017). Two theoretical orientations profoundly impacting literacy research and pedagogy are behaviorism and constructivism.

A behaviorist perspective on eye-tracking

The foundation of behaviorism, where component skills were expected to build upon one another, could seem a logical basis upon which to form models of literacy (Smith, 1999). American psychological and educational research applying eye-tracking technologies to literacy was overwhelmingly influenced during the mid-twentieth century by the theoretical model of behaviorism (Paulson and Goodman, 2008; Goodman et al., 2016). The impact of this theoretical lens of eye-tracking, as applied to special populations, has been described and the limitations detailed (Damico et al., 2021). Eye-tracking techniques appeared to fit seamlessly into models oriented to the quantification of observable behaviors. Historically, plotting the reflection of harmless infrared light off of a reader's cornea enabled researchers to create a visual representation of the path followed while viewing a text. The data points monitored by eye-trackers captured fixations, as well as the sequenced path of inspection (Rayner, 1998, 2009).

With eye-tracking technology as a data collection tool, inferences were then made about how visual information was utilized by the reader. The theoretical assumptions guiding eye-tracking research from this lens become transparent when selection of stimuli and the expected responses were considered. Adopting a behaviorist theoretical stance, many eye-tracking studies of reading have chosen to present decontextualized symbols, words, and sentences where speed and accuracy in identification were the required outcomes necessary for determining whether or not the individual viewed the stimuli. Rarely considered with behaviorist approaches, were the types of reading engaged in by individuals in the classroom and certainly not in day-to-day life. Missing were studies of readers transacting with complete texts for the purposes of understanding information and integrating it into their prior background knowledge. From studies of eye-tracking, interpreted through the lens of behaviorism, assumptions about how children interacted with texts have resulted in advocacy of practices inconsistent with biological and physiological abilities of both the brain, and its handmaiden, the eye (Strauss et al., 2009; Goodman et al., 2016).

Eye-tracking through a social-constructivist lens

When a different theoretical model is applied, the same data reveal substantially more interpretive adequacy in accounting for how the brain directs the eyes in the process of making sense of print. Social-constructivist theory provided this contrastive view, and with it, a different understanding of neurological processes that are built from its purpose emerged. From the social-constructivist perspective, human interaction with the environment is one led by an overarching march toward understanding. Humans are driven to make sense of their environment, a search for meaning that is reliant upon and driven by the meanings we construct from the knowledge we have and obtain. The mind drives this process by making predictions about the world around and directing the senses to obtain confirming or disconfirming information. Paulson (2000) and others after him (Duckett, 2001; Freeman, 2001; Liwanag et al., 2017; Nelson et al., 2008; Perde et al., 2020), applied eye-tracking technology to the study of reading starting from a social-constructivist view of human learning.

Their assumption that reading was a meaning-making phenomenon informed their selection of stimuli as well as the analysis they employed to interpret the visual sampling patterns of readers (Goodman et al., 2016). The juxtaposition of eye movements occurring within the transaction of reading complete passages, offered insights into instances where readers produced unexpected responses. These unanticipated responses or oral reading miscues (Goodman, 1967) revealed how readers strategically drew upon systems of background knowledge. An investigatory integration of eye-tracking technology with the study of oral reading miscues (EMMA) offered greater interpretive adequacy. This enabled researchers to better account for the background knowledge readers brought to the texts as well as offering insights into the cognitive processes engaged in as visual sampling occurred.

Because theoretical approaches offer a lens through which research can be understood, considering research findings from the perspective that best accounts for the data yields greater understanding of phenomena in question. Contributions of the 100-plus years of eye-tracking research can be more adequately integrated to assist in understanding how readers make use of visual information if the theoretical lamp of social constructivism is applied to the data. Similar interpretive adequacy and supportive evidence better informs the implications of this research on pedagogical practice. In the sections that follow, we discuss contributions of eye-tracking through the lens of social-constructivism to the understanding of reading in general and the extensions of it to special populations.

Major contributions of eye-tracking research to understanding literacy

Strategic visual sampling

A significant contribution of eye-tracking technology to reading research, including variables associated with special populations, is the understanding that readers visually sample print through a progressive series of rapid, ballistic movements (i.e., saccades) and moments of relative stability (i.e., fixations) (Rayner, 1998, 2009). How readers sample visual information may run contrary to the general belief that eyes move continuously and smoothly across the page during reading only pausing occasionally at difficult moments. The history of eye-tracking technology applied to reading research has demonstrated that the process is, in fact, not always continuous or smooth (see the variable scan paths in Figs. 1 and 2). Eye movement research has revealed that a reader systematically alternates between fixations and saccades (Rayner, 1998; Hung, 2021). Furthermore, it is only during fixations that a reader is able to clearly focus on print (Strauss et al., 2009). Current technology typically defines the accuracy of identifying fixations as falling within 0.5° of the visual viewing angle or about two-three alphabetic characters (Rayner, 2009). That means, when the font size and distance between print and reader are constant, the technology can identify, very narrowly, the specific letters of a word the reader is looking at.

Operationalizing fixations in this way is relevant to reading researchers because it is at the point of fixation when the fovea has the largest degree of visual acuity. Outside of the fovea, the area referred to as the parafovea, acuity quickly diminishes. A reader must reposition the fovea (i.e., produce a saccade) in order to visually sample print outside of a fixation (Schotter and Rayner, 2013). However, current belief is that vision is suppressed during saccades leaving the reader, in effect, blind during these ballistic movements, though mental processing does continue (Schotter and Rayner, 2013; Irwin, 2004). Because of these facts, eye movement research has focused largely on what information is available to readers during fixations and on understanding how the mind is able to direct the reader, via saccades, from one fixation to the next (Hung, 2021; Schotter and Rayner, 2013; Rayner et al., 2006; Strauss et al., 2009).

The nonlinearity of scan paths

Interestingly, readers do not visually inspect every word while reading as demonstrated by the words not fixated on in Figs. 2 and 3. In fact, there is great variability between readers and within readers on how many words in a passage they will fixate (Paulson and Freeman, 2003). A number of factors contribute to this variability including reading proficiency, predictability of text, and purpose for reading (Krstić et al., 2018; Paulson and Henry, 2002; Rayner, 1998, 2009). Nevertheless, readers typically fixate between 60 and 80% of the words while reading (Paulson, 2000; Rayner, 1998; Just and Carpenter, 1987). That means that 20%–40% are not fixated, they are visually skipped. Paulson (2000) also demonstrated that a reader would vary the number of words fixated from sentence to sentence and connected this to the predictability and complexity of the text. For example, one of his participants fixated 50% of words in one sentence only to fixate 77% of the words in a sentence later on in the same passage. All the while, the reader verbally produced every word in the passage accurately (Paulson, 2000).

While many studies describe the fact that readers visually skip a significant portion of the words in a passage when reading silently and out loud, readers in both conditions report perceiving that they had visually inspected every word. Furthermore, in the case of reading aloud, in many instances readers actually verbally produce the words that are not fixated (Paulson, 2005; Schotter and Rayner, 2013). On those occasions when the reader's verbal productions differed from the print, eye movement research has shown that this verbalized word was typically visually inspected prior to the verbal production (Paulson, 2005; Paulson and Henry, 2002; Percle et al., 2020). The difference in these instances was on how long the words were fixated, how many fixations a specific word received, the order in which the reader fixated the words, and the questions the reader was asking of the text in the moment. The questions of overall fixations, fixation durations, and saccade length are considered global measures of reading difficulty in the study of eye movements. All of these variables are clearly influenced by how difficult the text is to the reader (Rayner et al., 2006; Schotter and Rayner, 2013; Seassau and Bucci, 2013), a finding with great relevance to special populations (Clark et al., 2021; Krstić et al., 2018). Eye movement research has focused on understanding how these variables reveal the processing efforts of a reader. It is therefore important to consider the general pattern of these variables produced by readers in order to understand how visual input contributes to processing of print.

Normative eye movement patterns from reading

Consistent with a social constructivist theoretical stance, our review of the literature in addition to our research and clinical experience indicates that variations in eye movement patterns of special populations reflect proficiency in reading rather than symptomatology of impairment (Damico et al., 2021; Goodman et al., 2016; Tracey and Morrow, 2017). That is, readers qualifying under special population guidelines demonstrate eye movement patterns consistent with neurotypical readers of similar reading proficiency (e.g., Ferguson et al., 2019; Nelson et al., 2008). Therefore, when considering normative data's application to special populations, educators and researchers should adapt interpretations to readers of similar proficiency.

Overall, normative data for average fixation duration have been identified for both silent and oral reading. In neurotypical individuals there appears a general decreasing length of fixation duration as readers develop into adulthood. Rayner and Juhasz (2006) reported general changes in eye movement data as neurotypical readers progress across early grade levels toward adulthood and implied greater reading proficiency. The average fixation duration time for silent reading in the early grades ranges between 348 and 425 ms in children 8–9 years of age (Tiffin-Richards and Schroeder, 2015) to an average duration for adults of 225–250 ms (Rayner and Juhasz, 2006). Oral reading shows a similar pattern with a consistent decrease in average duration time across from childhood to adulthood (Rayner, 2009; Seassau and Bucci, 2013).

Saccades last on average between 20 and 50 ms and comprise an average distance of six-nine characters (Rayner and Juhasz, 2006). Just like in oral and silent reading fixation duration times, there is general variability between the distance covered by readers during saccades. In oral reading, readers average approximately six-seven letters per saccade and seven-nine letters during silent reading. Rayner (1998) attributes this variability to the fact that the movement of the eyes is forced to slow as they wait for verbal production to catch up. This eye-voice gap, or eye-voice span, suggests that in most instances, the eyes are slightly ahead of the voice. Further, as the complexity of the reading process increases, studies have shown that the reader's fixation duration times increase and the distance between saccades decreases (Schotter and Rayner, 2013; Rayner et al., 2006; Rayner, 2009; Paulson and Freeman, 2003). Of relevance for understanding the reading process is the notion revealed in the fixation duration data. As demonstrated by differing fixation durations in Figs. 1–3, readers do not spend the same amount of time on each word. The length of visual inspection appears to be closely related to the reader's comprehension of the passage (Rayner et al., 2006; Paulson, 2000, 2005; Schotter and Rayner, 2013). In instances where comprehension difficulties arise, a number of studies have documented increases in fixation durations and a reduced saccade distance; a pattern also observed in beginning and impaired readers (Ashby et al., 2005; Rayner, 2009; Paulson, 2000; Duckett, 2002; Nelson et al., 2008; Percle et al., 2020; Clark et al., 2021).

Nonlinear characteristics of eye movements in reading

A second contribution of eye movement research to the understanding of reading is the realization that reading is not a strictly linear process (Hung, 2021). The history of eye movement research has informed us that readers do not begin at the first letter of the first line and (in English) read smoothly in an undeviating manner from left to right, top to bottom (Nelson et al., 2008; Paulson and Freeman, 2003; Paulson and Henry, 2002; Rayner, 1998, 2009). A simple illustration of this pattern of behavior comes from where the initial and final fixations produced by readers usually appear. Typically, the first fixation produced by a reader occurs approximately five-seven letter spaces from the beginning of the line of text. Returning to Fig. 1, we see the first fixation in line 308 occurring on the fifth letter and the final fixation occurring on the fourth to last letter. This would suggest the reader did not focus on the first few or last several letters of the passage they were reading.

Variables influencing fixation location

This data is consistent with the previously discussed notion that readers do not fixate every word in the text. Just as there exists great variability across readers and texts as to the exact number of words that receive fixations, there is also variability as to where in the words those fixations occur. The proficiency of the reader and the predictability of the text again contribute to fixation location within the word (Rayner et al., 2006). Carpenter and Just (1983) observed that while the majority of words are fixated, readers skip a significant percentage of words (60%–85% of words). This phenomenon appears to be informed by a wide range of variables, (Flurkey et al., 2008; Rayner, 1998; Percle et al., 2020). The tendency is for readers to fixate in the middle of words 4–10 letters long

if they are presented in isolation; however, the patterns become much more complex when words are presented in context. In fact, Paulson and Henry (2002) demonstrated that the purpose of the reading, in addition to word length and context, influences where the reader will fixate. Paulson and Henry found that readers reading a passage for the purpose of retelling the passage fixated in significantly different places within words and the overall text than they did when reading a passage for the purpose of answering multiple choice questions. How and where the reader visually inspected the words in the passage was directly influenced by the nature of the task.

Patterns of regression

Further demonstration that the reading process is not a strictly linear phenomenon is informed by the production of regressions. Regressions are moments when a reader's eyes move backwards in the text. While most of a reader's fixations move progressively forward through the reading passage, approximately 10%–15% of fixations in neurotypical literate adults can be classified as regressions. Approximately 28% of fixations produced by beginning readers in first Grade can be counted as regressions with their overall average fixation duration times equaling nearly 1/3 of a second (Rayner and Juhasz, 2006). Rayner (2009) further shows that beginning readers produce more than twice as many fixations per 100 words than adults. As the reader matures and assumedly becomes a more proficient reader, systematic reduction in all three of the represented indices of eye movement are observed. By adulthood, the fixation duration times, average number of fixations per 100 words, and percentage of regressive fixations appears to stabilize. The fact that readers across all grade levels and ages consistently produce a substantial percentage of backwards eye movements, while skipping some words and fixating multiple times on other words, further suggests that the reading process is not strictly linear. Further, there is a great variability as to where on the word a reader will fixate both on initial and successive fixations as well as on regressions (Rayner, 1998).

Variations in eye movement due to text difficulty and reader purpose

The percentage of regressions and the total fixation duration times on a single word are global measures of reading proficiency and are clearly influenced by the reader's construction of meaning through transactions with the text (Percle et al., 2020). More difficult texts typically lead to more regressive saccades, shorter saccades, and an increase in duration and number of fixations. The number of fixations classified as regressions increases when the reader encounters particularly long words or experiences comprehension difficulties or linguistic confusion (Rayner, 2009; Just and Carpenter, 1987). Beginning readers and readers identified as dyslexic also demonstrate a greater number of regressions and are consequently more likely to produce an increased number of overall fixations, average fixation durations, and overall gaze duration times (Ashby et al., 2005; Rayner, 2009). That is, the eye data reveal how less expert readers, regardless of label, tend to sample less efficiently as they search to construct meaning.

Additionally, the type of reading material and the reader's purpose in reading it influence these measures (Pollatsek and Rayner, 1989). The ways in which readers interact with text are individualized. They are selected purposefully through a predictive process based upon the reader's unique experiences with and knowledge of the world. Paulson and Henry (2002) demonstrated this individual power of purpose. In this study, researchers asked students to read from both a standardized test battery, which claimed to reflect authentic reading, and a reading passage, where the purpose was simply to retell the passage at the conclusion of the reading. The researchers found that while the percentages of fixations and number of words fixated were similar across conditions, it was visibly clear that the same reader transacted with the two passages in very different ways. The eye-tracking data from the testing scenario contained significantly more fixations and the reader bounced between the questions and the portion of the text from which the questions came. Contrasted with this were the eye movements during the authentic reading condition. Here, data reflected a smoother progression through the text with fewer regressive eye movements. The reader's fixations resulted in a higher number of regressions during the standardized assessment. The conclusions drawn from this and other studies (Percle et al., 2020) suggest that the purpose of the transaction with text greatly influences how the reader samples from the passage.

Which words are fixated?

A third contribution of eye movement research to the study of reading involves an increased understanding of how the brain directs the eyes to visually inspect specific types of information (Strauss et al., 2009). Emerging research demonstrates an evolving understanding of how environmental stimuli are obtained and understood by the brain. Central to this shifting paradigm is a developing understanding of how predictions drive interactions. These predictions are individualized as they are developed purposefully based on each individual's unique previous experiences and interactions with the world. In turn, the brain purposefully directs sampling of sensory information from the environment to confirm or determine a need to alter these predictions.

This movement toward understanding of the brain as selective and purposeful in its transactions with the environment finds a parallel in the application of this theoretical lens to the phenomenon of reading and other literacy practices. Applied to reading, individuals make predictions about the text and gather supporting information. This model described as a "sociopsychoneurolinguistic" transaction is demonstrated and supported by eye-tracking research (Goodman et al., 2016, p. 35). The written symbols constructing text, while phenomenal in their significance, are no different than other stimuli the brain interacts with in that they are primarily a source of information. The brain transacts with text through this same purposeful sampling of stimuli for the same meaning-making purpose of confirming predictions. These complex neurological actions are internal; however, they are not fully invisible to researchers. Eye-tracking methodology, when combined with indices of comprehension, allows us to visualize this meaning-making process in unique ways.

After studying readers engaged in sentence and essay reading tasks, Fisher and Shebilske (1985) concluded words not fixated were still processed. That is, the reader still makes sense of the specific skipped word. For example, function words prior to content words are more likely to be skipped while still being processed. This is especially evident when the content word is longer than the overlooked word (Drieghe et al., 2007; Rayner, 2009). Paulson (2000) demonstrated that readers clearly make predictions based upon their expectations and this is observed in number and location of the fixations produced. When a reader is able to predict the text, they require less of the visual information. Conversely, when the text is less predictable and more challenging for the reader, they fixate on those portions of the text that give them the information necessary to process the passage. For example, readers will fixate on content words about 85% of the time while fixating on function words only 35% of the time (Carpenter and Just, 1983; Duffy et al., 1988; Rayner, 2009).

Paulson (2000), looking at oral reading of longer, more complete passages, found his readers fixated on 79% of content words and 46% of function words. Paulson argues the pattern of fixating more on content words than function words reveals the processing patterns of the reader. He proposes that when readers skip function words, it is most likely because they have constructed the syntactic pattern of the sentence and need to focus on the semantic information conveyed. Additionally, function words are often short and represent fewer grammatical options for a reader. This may be why two-three letter words are fixated only 25% of the time while words of eight letters or more are almost always fixated and in fact more likely to receive multiple fixations (McConkie et al., 1989; Rayner et al., 1996). From these data it is clear that visual inspection of lines of text is not a uniform and smooth progression from left to right; rather, visual sampling in reading is a strategic act of focusing on the areas of print that will provide the reader with useful information.

Limitations and conclusion

Despite the obvious advantages of eye-tracking methods, there are specific limitations and methodological issues that need to be considered, specifically when considering applications to special populations. For decades, the cost of equipment needed for eye-tracking and the time needed to become proficient made practical applications to educational settings unrealistic. In recent years, technological advances have minimized these limitations; however, others remain. We choose to highlight three additional categories of Design and Initial Procedures, Data Processing and Analysis, and Interpretations.

Design and Initial Procedure

Determining gaze location is one of the earliest steps that helps with processing eye-tracking data and comes with its own challenges. Eye-trackers require calibration at the beginning of the task which can be disadvantageous when working with special populations due to challenges with attention and comprehension of motor commands. To manage this issue, it is suggested to use dynamic and musical animations during the calibration process to assist in attracting the individual's attention. Nevertheless, in research studies some individuals fail to complete the calibration task and need to be excluded (Venker and Kover, 2015). This exclusionary practice is inappropriate for classrooms where inclusion is a significant priority. Furthermore, there appears to be an art to tracking individuals. Not all individuals are able to be tracked. For example, children wearing glasses may have lenses incompatible with the eye-tracker's infrared light system. Individuals on medication may have delayed pupillary responses. These issues and others make calibration a challenge (i.e., Nyström et al., 2013). Recalibrating at different points during data collection can help minimize these errors at expense of time and it also breaks up the nature of the reading task and may potentially impact comprehension. Educators and researchers seeking to answer questions using eye-tracking technology must consider these variables in light of the contexts in which they work.

Data processing and analysis

A second limitation of eye-tracking specific to reading research in special populations considers data processing and analysis. Individuals from special populations demonstrate similar eye movement patterns as neurotypical readers of matching competence. Limitations in processing and analysis of eye-tracking in special populations therefore are largely methodological and logistical. For example, manual offline coding of eye-tracking data is done frame-by-frame and by hand and requires extensive training, especially when it comes to special populations. Due to the challenging nature of obtaining eye-tracking data from certain special populations, they are mostly excluded from the studies, preventing the examinations of some of the factors that led to their deficits (Venker and Kover, 2015). In many instances, the challenges qualifying individuals for classification as a member of a special population make data collection difficult and time consuming. For example, when working with children who have sensory issues, use of head mounted eye tracking equipment can lead to intermittent data collection. Similarly, children who experience cognitive limitations may have difficulty following instructions or staying engaged in the experimental tasks. During analysis, researchers must understand and take care to account for variability such as this. Additionally, these challenges in working with special populations may lead to data collection and analysis stages occurring over longer periods of time, resulting in lengthy time lapses, coder turnover, and reduction in the reliability of the data (Wass et al., 2014; Venker and Kover, 2015).

When it comes to data processing by eye-tracking devices, on the other hand, researchers should be aware of the default processing algorithms that define temporal and spatial parameters (i.e., defining limits of fixations and saccades). These algorithms may allow poor measurement qualities to mask the true eye movement patterns by developing undesirable relationships between the quality of the data and the length of fixation (Wass et al., 2013). There are options available to customize these algorithms but modifying the algorithms may dramatically change a study's results. In order to account for or control the behavioral and procedural challenges, often the nature of the reading tasks must be modified in order to collect useable data. Consequently, the ecological validity and authenticity of what the reading task represents is altered. The researcher's theoretical stance is typically what governs the acceptability of the modifications needed to work with special populations.

Interpretations

Eye movements are reflective of both the text variables and the reader, and each reader produces unique patterns of movements and miscues based on the organization of the text and how the text is being approached by the reader. Since reading is active and constructive, readers modify the text instead of modifying their minds. Eye movement research offers researchers and educators insight into the ways readers interact with texts. As demonstrated throughout this entry, interpretation of eye-tracking is dependent upon a researcher's theoretical understanding. Given purpose-driven interactions readers bring to texts, reading research, including that involving eye tracking, should be centered around authentic reading tasks. Additionally, in order to make sense of the eye tracking data, a reader's eye movements must be considered alongside some measure of their comprehension. When comprehension is included with eye tracking data, a map of readers strategies as they interact with texts can be constructed. Understanding the strategies employed by all readers can have significant implications on special populations whose paths to literacy success are often unique and nuanced (Nelson et al., 2020).

Communication is an integral component of successful academic achievement. The amount of available knowledge and information has exponentially increased over the last several decades. Many types and forms of literacy media have been devised or invented but there is no medium other than braille that has been most widely adopted among people with visual impairments.

This chapter discusses the importance of braille literacy by reviewing existing literature and suggesting ways that research activities in braille reading be implemented. First, the history of braille along with key literature and events associated with adoption of braille code is discussed. Second, current issues and significant aspects of braille reading are noted. Finally, questions about the future of braille along with emerging topics of braille research are suggested.

History of braille

Students with visual impairments have unique needs when compared to print readers with regards to literacy development. Just as the primary medium of reading and writing for sighted students is print, that of students with visual impairments is braille.

Although Louis Braille did not live to see braille adopted as the official medium for people with visual impairments, it has become internationally adopted soon after his death (Bogart, 2009; Irwin, 1970). Braille enabled people with visual impairments to appreciate literacy skills, which is an important tool to participate equally in this society. Though braille is only used dominantly among people with visual impairments, efforts had been given in developing and creating alternative tactual methods of reading and writing long before its invention.

They took the form of writing on wax tablets, providing letters carved in wood, teaching a blind person to follow the shape of letters in grooved woodblocks, forming letters by wire, using knots of varying thicknesses and in varying distances on a thread, forming letters by pins stuck into felt or similar material, pinpricking letters tangible in relief, and so forth (Lowenfeld et al., 1969).

Practical means of beginning of literacy for people with visual impairments did not commence, however, until the invention of braille by a Frenchman named Louis Braille.

Braille system and contractions

Braille is comprised of 26 letters, punctuations, and contractions. Braille has two horizontal and three vertical dots in a cell. The combination of six dots can express sixty-three different symbols. Table 1 presents 26 alphabet letters and commonly used punctuations. A limitation introduced by the lack of variations that can be expressed by a single cell required to use a dot formation for more than a letter. For example, dot 14, presenting the letter c is used to write 3 or the word “can” depending on the context where it is used.

Braille takes more space than print. In 18th century when braille was first created, production cost was directly related to space of a material and Lewis Braille came up with a set of contractions, which were comprised of letter combinations, different dot formations, or combinations of both. Contractions were believed to make braille reading and writing faster. Several studies have been conducted to answer these questions. Nilsson (1982) examined the reading speed of braille. After comparing reading speed using

uncontracted and contracted braille, the author concluded that contracted braille demonstrated a higher mean score of reading speed, suggesting that contracted braille contributed to the faster reading of braille. While participants in the study were all contracted braille readers and having them to read uncontracted braille would negatively influence their reading speed and materials used for the study were back-translated from contracted to uncontracted braille, findings of this study supported the idea that contractions would make braille reading speed faster. A measure that may warrant more scientific findings would need to use words that were otherwise typically not contracted. On the other hand, [Troughton \(1992\)](#) conducted a research study to determine the actual differences of reading speed between uncontracted and contracted braille. On this study where 125 people participated, she used materials that were chosen from words that could not be contracted. Selected uncontracted words allowed the researcher to isolate potential noise that could be introduced by using back-translated materials. For example, since “dog” does not contain any contraction, regardless of previous knowledge with contractions, readers were not disadvantaged. If “people” was provided as an example, those who already learned contracted braille should read spelled out version of the word that was different from their conventional usage. She found that 113 participants read faster when using uncontracted braille and only 11 participants were faster in contracted braille. This finding supports the idea that faster reading speed in uncontracted braille is expected when materials are carefully selected.

Another study that added a significant finding into this topic was conducted by [Lorimer and Tobin \(1979\)](#). They conducted a study to identify a relationship between the number of contractions and reading speed, by employing four different combinations of braille contractions. Three of them reduced the number of contractions, and one expanded the code. Their findings suggested that reduction of contractions in codes did not influence students’ reading speed. On the other hand, the code with a greater number of contractions was responsible for lowering the rate of reading speed. When considering that [Lorimer and Tobin \(1979\)](#) and [Troughton \(1992\)](#) controlled unexpected variables introduced by back-translation and selection of participants, it is hinted that the use of uncontracted braille did not negatively influence reading speed.

A major advantage of contracted braille to consider is its space saving and reduction of production costs. [Kederis et al. \(1965\)](#) found that 31% of space could be saved by using contracted braille and, when including numbers, punctuation, and special signs, 26.5% of space could be saved by employing contracted braille. [Durre \(1996\)](#) randomly selected 39,717 words to analyze space-saving features of contracted braille. The result suggested that contracted braille took up to 20.42% less space than print. What is also important to note is that the top-ranked 100 contractions contributed to 95% of total space-saving. For example, as shown below, commonly used contractions such as “and” “with” or “the” contribute greatly in reducing the space, when compared to print.

A couple of points to consider are the extent to which the space-saving features of contracted braille can be implemented in actual braille materials. For example, children's books, including textbooks for early graders, are not as thick as those used by older students and adults, and they often include many tactually adapted drawings and pictures of objects which may cancel space-saving due to the use of contractions. In addition, braille production's costs and processes have evolved and changed over the years and it can be concluded that the identified level of space-saving would be accountable for marginal differences. The use of refreshable braille displays, which are designed to express braille electronically by raising and lowering different combinations of pins in braille cells, may be contributable for further reducing the gaps between uncontracted and contracted braille. Fig. 1 illustrates a diagram of a refreshable braille display and its mechanism for producing braille.

Adoption of braille in the United States

Braille became the official medium for students at the Institute for the Blind in Paris in 1854, 2 years after the death of Louis Braille. Later, braille was adopted in the United States in 1860 and became the official medium at the Missouri School for the Blind. At the time when braille was introduced in the United States, several other tactile codes were already in competition with one another. This conflicts between braille and other systems (including the Moon type, New York dots, and Boston type) are known as "The War of the Dots" (Irwin, 1955, p. 1), "The Battle of the Types" (Farrell, 1956, p. 105), and "The Battle of the Contractions" (Lowenfeld et al., 1969, p. 8).

New York Point, one of the most widely accepted tactile code for people with visual impairments other than braille, used one to four pairs of points set side by side, each containing one or two dots. New York Point was devised by William Wait, a teacher in the New York Institute for the Education of the Blind, and its composition was done through adding additional dots vertically. This was known as variable base. New York Point used very few capitals and common punctuation signs. Fig. 2 shows lower case letters in New York Point.

Another code used at the time, though not as popular as New York Point, was modified braille. The idea of the code was to assign commonly used letters for braille formation with less number of dots. Farrell (1956) reported that the Modified system could be considered as the most scientific method of arranging dots. "The War of the Dots" was, in most cases, a battle only between braille and the New York system. In 1909, New York Public Schools decided to adopt braille as an official medium for reading and writing of people with visual impairments. In 1916, agreement settled on English Braille and this is mainly due to its capacity for expressing punctuations and the large amount of written material available in English Braille.

Unified English Braille (UEB)

Since then, literary braille code maintained most of its rules and contractions while conveying mathematical and scientific notations has evolved in the form of the Nemeth Code, a code for Braille Mathematics and Scientific Notation. Developed in 1946, Nemeth code was aimed at creating set of experiences of readers that printed text would be translated accurately and technical literature would be presented and read in braille (Nemeth, 1972). Some examples of the Nemeth code are shown in Table 2. Although Nemeth code did not go through extensive revisions, discussions about literary braille with regards to its ambiguity and necessity of additional signs and letters were beginning to emerge (Cranmer and Nemeth, 1991; Jackson et al., 1993).

	Fraction Lines (over, divided by): Horizontal Complex Fraction Line			—		
	Fraction Lines (over, divided by): Diagonal Complex Fraction Line			/		

The initial discussion of a unified braille code took place through the Braille Authority of North America (BANA), the standardizing body of English Braille orthography in the United States and Canada (Bogart et al., 2000). The primary goal of a unified English braille was to better facilitate the use of technology in the production of braille and to reflect changes in printed letters and signs (BANA, 2012). The International Council on English Braille (ICEB), began work to develop a unified braille code (Bogart et al., 2000). Unified English Braille (UEB), was adopted the US in 2016 (D'Andrea, 2013).

UEB makes a number of significant changes to the original English braille. Changes in contractions and ways that the contractions are used, punctuation marks, ways that computer symbols are written, rules for capital sign and indicators for expressing changing text attributes, use of numbers in literary braille, and so on are a few examples that the UEB brought to many braille readers. Potential impacts of the adoption of UEB will need to be studied from multiple perspectives.

Current practices for braille instructions

Most students who are visually impaired may use one medium such as print or braille to read and write, but some are taught both when their visual condition is likely to change or when students are unable to read print efficiently (Lusk and Corn, 2006). In recent years, teachers of students with visual impairments have begun conducting learning media assessments to help in determining the appropriate medium for reading and writing. Learning media assessment, initiated by Koenig and Holbrook (1995), combines the primary use of sensory channels, measures of reading speed, and use of an informal reading inventory through observations to identify the student's primary medium for literacy. This section reviews key research studies related to instructional aspects of braille reading, writing, and their implications.

Reading development

Numerous differences exist in literacy development of students with visual impairments, and it will be necessary to examine common stages of reading and ways that such stages can be extended to braille reading. For students who are in the early stage of reading, it requires additional intervention to make sure that they have sufficient preliteracy experience to begin a formal braille reading program. Wormsley (1997) noted that early exposure to braille was important, regardless of readiness of a child with visual impairments, toward official reading intervention. For instance, environmental modifications such as adding braille labels on common household objects, placing name cards at home, and making signages available in braille could allow children to explore braille in their daily lives (Drezek, 1999; Koenig and Holbrook, 2000). Unlike their sighted peers whose family members can read and write print, many family members may not read and write braille and it would be difficult for them to provide similar support (Craig, 1996).

Craig (1996) reported that, among 112 study participants, approximately one-third of them could read braille. Limitations paused by lack of environmental braille and lack of family involvement in creating such environment for students with visual impairments will serve as an obstacle for braille rich environment and call for the needs of early intervention by teachers of students with visual impairments. Otherwise, children with visual impairments may be deprived of developing early literacy experiences.

An interesting aspect of literacy development and their relationship with braille is that decoding skills might be influenced by contracted braille. Not only do they require sufficient understanding of the language, but they also are exposed to an additional challenge. The letter *c* has a different pronunciation, depending on where it is located in a word. *C* in the word *cab* makes a *k* sound but, in the word *ice*, it makes an *s* sound. Before appropriate development of understandings of phonetic rules, students may be confused by the fact that the letter *c* can be used as in *can* and in *cat*. Though many students with visual impairments have adjusted to such variances, it cannot be assumed that confusion associated with contractions does not create additional barriers in literacy development.

O'Donnell and Wood (1999), proposed five stages of reading: emergent reading, initial reading, transitional reading, basic literacy, and refinement. The authors stated most preschoolers and kindergartners could be classified in the emergent reading stage, which functions as the gateway to literate life. During this stage, students familiarize themselves with print. In the second stage, students learn the relationship between print and spoken language. Furthermore, students expand their knowledge to unfamiliar words. The next stage is aimed at reading more fluently and making sense out of reading. In the stage of basic reading, students work to learn from reading. Students read in order to gain knowledge from materials. The final stage is for refining previously learned reading competencies as well as learning thinking competencies.

Examining the importance of reading and literacy development of students who use braille as the primary medium suggests close collaboration between teachers of students with visual impairments and classroom teachers. Wittenstein (1994) suggested that the introduction of braille code only to preservice teachers of students with visual impairments led to negative attitude toward braille. Teaching methods of braille along with ways for collaboration with classroom teachers are the key component of positive attitude of teachers of students with visual impairments toward braille. Furthermore, according to the U.S. Department of Education, Office of Special Education and Rehabilitative Services, it is essential that a student receives ongoing support from a professional, trained for becoming proficient in Braille reading and writing (U.S. Department of Education, 2000). Yet, as mentioned, braille code does not correspond directly with printed letters. Collaborations with reading specialists or classroom teachers will be the key component of successful intervention for reading and literacy development (Munro and Munro, 2013).

Braille writing

Another difference is in the way that braille materials are produced and the method that braille writing is taught. Students using braille as a primary mode of reading and writing begin using a Perkins braillewriter, a device that embosses braille characters on paper with the use of six key entry. [Erin and Wright \(2011\)](#) reported that 39 students who participated in their study used the Perkins braillewriter until second grade. Only two students used assistive technology options for producing braille materials. The Perkins braillewriter requires more physical strength as well as mastery of processes such as loading braille paper, which is different from print users where the fine motor skills are reinforced for handwriting. Alternatively, a device called the *slate and stylus* is used for writing braille by students, but is criticized for its mechanism where dots are inverted between writing and reading and users need to write from left to right to compensate such differences. [Fig. 3](#) and [Fig. 4](#) show a picture of a slate and stylus and a Perkins braillewriter. More and more teachers actively adopt assistive technology options in writing braille, using braille notetakers, electronic devices that use refreshable braille displays and six key entry.

On the Perkins braillewriter and the braille notetakers, Braille letters and contractions are created by pressing combinations of six keys, except on some braille notetakers where a qwerty keyboard system is used. The letter “a” requires pressing only a single key, whereas the symbol for the word “for” is written by pressing all six keys simultaneously. Insufficient pressure on a key or misplacement of a finger on key combination can result in braille errors. For example, the letter “f” can become the letter “p” only if one dot “dot3” is added. Careful assessment needs to be made so that mechanical and syntactic errors are differentiated. Newly developed assistive technology options such as braille notetakers can alleviate certain challenges associated with the physical nature of the Perkins braillewriter and can provide instantaneous feedback to students through speech.

Existing studies reporting the use of assistive technology options for writing braille by students with visual impairments suggest satisfaction and motivation. However, cautions should be given where few studies found quality outcomes and user performance when assistive technology options were deployed. Discussions on the observed differences of an assistive technology option such as electric braillewriters go back to a study conducted by [Koenig and Ashcroft \(1983\)](#). They found no differences in writing speed or accuracy. More recently, [Bickford and Falco \(2012\)](#) reported results comparable with the previous study. They found no clear advantage in outcomes for the early use of electronic braille notetakers for writing. They noted meaningful progress in writing samples for students who produced written material electronically, nonetheless the measurement was not significant. Another study focusing on satisfaction and motivation of students using assistive technology options was conducted by [Cooper and Nichols \(2007\)](#). They

Fig. 3 A diagram of a Perkins brailier with a hand positioned to push keys.

Fig. 4 A user writes braille using a slate and stylus.

reported positive perceptions by teachers of students with visual impairments and students who used the Mountbatten electronic braillewriter. No measures of writing performance were reported as part of the study.

A more current investigation by D'Andrea (2010) looked into ways that technology options were utilized by students with visual impairments. She reported that 77 high school students with visual impairments were interviewed for the study. Participants used between four and eight devices to help them accomplish their tasks. Tasks such as writing letters, labeling, or editing, were accomplished by using braille. On the other hand, they indicated to use print for sighted instructors and classmates. As students grew older, more auditory tools and speech were adopted for accomplishing their literacy tasks. D'Andrea (2010) asserted the need for more research on writing by students with visual impairments in the areas such as decreased use of slate and stylus and technology use. She also suggested the need for additional research in the processes of writing and development of authorships among students with visual impairments.

Spelling

Research findings about braille readers demonstrate relatively minor differences in spelling performance compared to print readers. Some studies even report better performance in spelling by students who use braille. A major concern to focus here is the use of contractions in instruction and testing of spelling.

There has been significant concern about the effects of contracted braille on spelling skills of braille reading students. "By using contractions, we will gradually lose our ability to spell the words properly" (Nilsson, 1982, p. 199). Johnson (1989), for example, reported that those who learned uncontracted braille in the early grades exhibited better spelling skills than those who received instruction using contractions. The findings implied that students using contracted braille may not develop their full potential in spelling due to the difficulty of contractions. For example, the word "would" in braille is contracted as "wd". If a student has never learned how to spell "would" and repeatedly written "wd" in braille, one may not correctly spell the word correctly. Godshall (1961) conducted a study to examine spelling skills of students with visual impairments, ranging from third grade to ninth grade. The author concluded that students using braille were above grade level when asked to write in uncontracted braille. Two standardized tests were administered to 227 students, attending to residential school programs. Students did better when they were asked to write in uncontracted braille (Godshall, 1961). The implication of this study is significant. The result suggests one of two things: teachers in classrooms are usually giving spelling tests in uncontracted braille and students might be accustomed to the practice, or students were able to master full contractions and rules of contracted braille.

Koenig (1987) confirmed better spelling performance of students who read braille. In his study, spelling skills of the two younger groups outperformed peers who were using print. Though the high school group was similar to print readers, these findings were supported by subsequent studies that found average to superior spelling skills by braille readers (Clark-Bishke and Stoner, 2009; Clark and Stoner, 2008; Emerson et al., 2009; Grenier and Giroux, 1997). Emerson et al. (2009, p. 618) stated, "A surprising finding was that spelling was a strength for these young braille-reading children, regardless of whether they used contractions or not ...".

Writing errors related to the braille code are described separately in some studies. Koenig (1987) reported the lower four dots of the braille cell such as "be, by, to, in, and was" accounted for substantial source of observed errors. It should be noted, however, that some of these contractions were eliminated in UEB. Erin and Wright (2011) presented that the majority of errors collected from samples produced by students were unrelated to the braille code. Phonetic errors that reflected irregular spellings were the primary source of errors, where a dot or dots were incorrectly placed on the wrong side of the braille cell.

Though significant differences exist in braille and cautions should be given for ways that literacy development of students with visual impairments are ensured, it is important that collaborations be facilitated between teachers of students with visual impairments, classroom teachers, and reading specialists. Familial involvement is equally important in creating braille rich environment so that proper pre-braille skills and foundation of literacy can be constructed.

Research implications of the future of braille

Several topics about braille and its implications for reading and writing development of students with visual impairments have been discussed. However, a number of other topics pertaining to the future of braille exist. The decline in the number of users who use braille as their primary medium has been reported in the existing literature. For example, Miller (2002) indicated that the number of braille readers has been decreased over the years. American Printing House for the Blind (2018) indicated that approximately 10% or about 5000 students with visual impairments identified braille as their primary medium. Rodenberg (1955) reported that more than 8000 children and 20,000 adults used standard English braille in the US and equivalent number of users existed in England. While it is difficult to ascertain the exact number of people with visual impairments in the US, it is clear that the proportional representation of braille users within the visual impairment population has declined.

Though a particular reason for the decline has not been identified, several potential factors might contribute to the overall implications of such observation. First, people who are elderly or who have multiple impairments are included when calculating the total number of people with visual impairments. Often, people who are elderly may not feel the need to use braille regularly, or their physical conditions may not allow them to use braille as the primary medium of reading and writing. Second, a lack of teachers for students with visual impairments may make it difficult for students with visual impairments to receive adequate instruction in braille learning. For example, In the 40th Annual Report to Congress on the Implementation of the Individuals with Disabilities

instruction and examinations of the roles that braille contractions play in braille learning be conducted to identify potential impacts of the use of contractions in braille. Now that adoption of refreshable braille display and electronic text negate the impacts of space saving and cost reduction of braille contractions, well designed research studies on this topic will be of great help in setting up an important foundation of the code.

Why is it so slow to read braille?

Braille is often considered to be slow when compared with print reading. Though many factors may contribute to the discrepancy, existing studies accuse inherent difference of utilized sensory channels as a potential cause. Visual readers read as many as 15 characters at a fixation while braille requires character level contact. Consequently, the amount of information retrieved through the visual sense is larger than that received through touch. For example, Foulke (1991) suggested that braille readers read 65–76 words per minute at the junior high school level and 80–90 words per minute at the senior high school level. Nolan and Kederis (1969) observed similar outcome and reported that the oral reading speed of students with visual impairments was 90 words per minute. Lowenfeld et al. (1969) reported reading rates of 116 words per minute for students in residential schools and 149 words for students in a public school setting.

Foulke and Smith (1973) and Troxel (1967) further examined this issue by creating an experience where print readers could only see a single character. Troxel (1967) gave participants a tube, with which only one character is seen at a time. Most participants reported that it was very difficult to read character by character. Some participants who reached a comfortable reading level exhibited 65–75 words per minute. Troxel (1967) concluded that reading character by character might explain the slow rate of braille reading.

Reported slow reading speed of braille led to some studies where efforts to increase the speed and to identify an interventional strategy for braille reading were implemented. Findings of such studies were inconsistent. Furthermore, the majority of studies was criticized by the lack of a control group and too many uncontrolled variables, caused by small sample size. For example, Umsted (1970) reported that faster reading speed was observed when providing additional practices in the area of short-form words and contractions among 72 participants. Participants in the better performing group gained as many as 25 words per minute, leading to the conclusion that the interventional strategy was effective and contributed to the improvement of reading speed. A different result was reported by Flanigan and Joslin (1969) where reading speed of 26 participants was increased but with more reading errors. They indicated a short span of training as a potential cause of this discrepancy. Other studies (Crandell and Wallace, 1974; Henderson, 1967; Olson et al., 1975) were conducted to delineate an effective means of providing interventional training for slow reading rate of braille readers. Repeated reading received attention from researchers as an instructional method in improving braille reading speed. For example, Stanfa and Johnson (2017) reported that three participants on their study showed notable increase in the reading speed when trained with repeated reading. Yet, none of the studies yielded significant differences mainly because the gain was not statistically significant or because extraneous variables were not controlled.

It is suggested that there should be a large-scale study to establish reliable speed of braille reading, which will serve as a foundation for designing and implementing interventional strategies for tactile recognition, mechanics of braille reading, and differences of employed modality (Mousty and Bertelson, 1985; Wright et al., 2009). In addition, factors and predictors of braille reading and associated variables need to be examined closely.

Why is braille reading cognitively and tactually demanding?

While a substantial body of literature exists on vision and its function for reading, touch has received relatively little attention. Millar (1997) identified passive or active aspects of touch. In active touch, one's hands, arms, and body are used to control the types of information obtained through the channel. On the other hand, information is gathered by cutaneous receptors which receive information when the skin is touched by an object in passive touch. It is known that fingertips have the highest tactile acuity (Millar, 1997). Fingertips exhibit the most accurate discrimination of a two-point threshold (to distinguish one object from another), which can identify as little as two millimeters of difference. It is interesting to note that braille dot density is around the borderline of this threshold. In the developmental stage, tactile discrimination follows this order.

1. Large solid geometric shape
2. Flat (puzzle pieces) figures
3. Embossed-dot geometric figures
4. Embossed-dot line figures
5. Braille figures (Kershman, 1976–1977)

Development of tactile sense begins with large object recognition before progressing to small and fine objects (Kershman, 1976–1977; Barraga and Erin, 1992). A child explores from large objects to small objects, from simple objects to complex objects, and from general objects to detailed objects. A child is ready to be exposed to braille when these skills have been sequentially developed (Kershman, 1976–1977). Characteristics such as passive touch versus active touch, the function of different hemispheres when reading braille, sensitivities of different body parts and their tactual acuity, and registration of the tactile sense to memory have received the most attention from researchers (Foulke, 1964; Kusajima, 1974; Millar, 1997; Nolan and Kederis, 1969).

Another area of discussion is about tactual sensitivity, applicable to people who have learned braille adventitiously or those who have other health conditions. A paucity of qualified personnel to work in braille coupled with the lack of understandings in this area

of research makes it difficult to devise effective programs and instructional strategies. Both perceptual and cognitive factors underlying proficiency in reading braille need to be studied, and discussions about characteristics of touch and its implication should be well understood.

Conclusions and future directions

This chapter examined the importance of braille literacy. Through literature review and analysis, this chapter suggested current issues in braille research and ways that research activities in braille would inform the field with regards to the unique needs of reading for people with visual impairments. First, the history of braille along with key literature and events associated with adoption of braille code was discussed. Second, current issues and significant aspects of braille reading were examined. Finally, questions about the future of braille along with emerging topics of braille research were presented.

First, though braille contractions have served an important role, a well-designed longitudinal study on the impact of braille literacy has not been conducted. When considering that spelling, reading speed, reading mechanics, and reading development are intimately related to contractions, the field needs to ponder the influence of braille contractions and their long-term outcomes for reading. The scope of such efforts may not be limited only to a unidimensional application of braille contractions but should expand to sophisticated implications of the roles of braille contractions for literacy development. Functional use of braille by people with multiple disabilities, refreshable and electronic braille, and a decline in the number of braille readers in the United States call for quick responses, informed by research.

Second, development of additional technology options for delivering braille will be of interests to many stakeholders. Though refreshable braille displays allowed readers with visual impairments to gain access to computerized braille, their applications are yet restricted to line by line display of braille text. Diagrams, tables, and pictures often require much larger display surface and current technology options cannot seamlessly accommodate such demands. Multi-line braille displays and haptic displays can potentially provide much more flexible options and development efforts and research activities to document these needs should be carried.

Third, it is disappointing that Many students with visual impairments who use braille exhibit slow reading speed when compared to their sighted counterparts. It is unclear whether slower rate of reading demonstrated by braille users are due to differences in visual comprehension or limitations associated with braille. However, what is more crucial is the need of a study, documenting the severity of such reading delays. While anecdotal evidence of slow reading of students with visual impairments have been reported, we do not know how fast or how slow a child using braille would read by grade level, to date, there is no data to substantiate reliable and accurate braille reading speed of people with visual impairments. In part, standardized braille speed by grade and or age may be very difficult to establish because of diverse visual acuity, experiences in reading, and additional disabilities. However, the lack of baseline data for braille reading speed makes it difficult to establish appropriate plans for mediating problems associated with slow reading speed.

There are notable concerns as to whether braille will eventually be replaced by new technology such as screen and print reading devices, which convert text into spoken words, or will become obsolete by rapid development of technology. However, no one argues that word processors make print obsolete. People with visual impairments need to have varying options for their literacy media. Everyone has the right to have access to information in their preferred format. For many, it is braille.

New Literacy Studies

What are New Literacy Studies?

New Literacy Studies emphasize a broadened and newer way of defining the contemporary and evolving nature of literacies, that is influenced by digital communication and newer technologies (Street et al., 2017). New Literacy Studies is defined as a body of work in which there is an understanding of multiple literacies that are changeable, multimodal, and aligned with social practices across time, place, and space (Chakrabarty, 2020). A key focus of New Literacy Studies is making connections between literacies that are situated across formal and informal learning environments, and physical and virtual spaces (Alvermann and Robinson, 2017). The term literacies is embraced in this paper as an inclusive way to use different modes of communication to support literacy education (Fig. 1).

Fig. 1 Conceptual framework of inclusive new literacies.

New Literacy Studies and literacy education

Recently, New Literacy Studies has influenced a renewed interest in all aspects of literacy teaching and literacy education (Chakrabarty, 2020; Street, 2013). In addition, there had been an emergence of new literacies, which suggests that the characteristics and mechanics of literacies are situated and are different across diverse contexts (Mills, 2010). Students' access to contemporary literacy practices have been dictated by the developments of a variety of digital technologies within social contexts that have facilitated the development of literacy skills (Gee and Hayes, 2011). Literacies are also mediated by the availability of and interrelationship between spaces, devices, and other people to interact with (Oliver, 2016).

Newer understandings of literacies have evolved with the emergence of digital literacies (Jones, 2012), global literacies (Yoon, 2016), technology literacies (Thomas, 2011), virtual literacies (Merchant et al., 2014; Zhao et al., 2021), information literacies (Mackey and Jacobson, 2008), and visual literacies (Gitsaki, 2015). These and other types of literacies are considered inclusive if they facilitate opportunities for repeated practice; reciprocal, motivational, collaborative, and cooperative learning with peers; and technology-based engagements, such as with digital texts and virtual adventures (Boon et al., 2013). However, literacies for students with disabilities and diverse learners is less researched and understood in New Literacy Studies, especially for students on the autism spectrum.

Inclusive literacy education

Inclusive literacy learning and support for diversity are valuable notions in New Literacy Studies and literacy research (Dovchin and Pennycook, 2017; Luke et al., 2011). This type of learning involves having insights into offline and online social practices of all learners and remoulding school policies, culture, and practices to meet students' diverse needs (Booth and Ainscow, 2011; Jorgensen and Lowrie, 2011). Inclusive literacy education entails cognitive processes that are mediated by social practices, technologies, narratives, complex arrays of rules, and cultural knowledges. Within this context, students of all races, cultures, socioeconomic backgrounds, abilities, and linguistic diversities have the right to access scaffolded learning, participation, and resources that support their education (Booth and Ainscow, 2011; Liasidou, 2015; Ravet, 2011). Therefore, in contemporary literacy research, educators are encouraged to build on notions of inclusive education and focus on differentiated support for students and their diverse needs (Ashman, 2014).

Inclusive goals linked to literacy research and education

The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD), declares that all students have the right to inclusive education (Committee on the Rights of Persons with Disabilities, CRPD, 2016; United Nations, 2018). Drawing on the guidelines of UNCRPD, Article 24, Comment Number Four (CRPD, 2016), literacy researchers and literacy educators need to understand and address:

- strategies by which diverse students can be supported through the literacies of information and communication technologies to meet their needs and targeted goals,
- ways to minimize challenges to literacy development and social practices, of all students, and
- ways to make reasonable accommodations for the literacy practices of social groups such as students with autism.

Core to inclusive literacy research is to draw attention to issues of diversity, inequality, and interventions, and to understand the real and daily challenges to social inclusion and barriers in literacies that students experience (Dovchin and Pennycook, 2017). Opportunities to fully participate within communities through semiotic resources, new knowledge, and skills in literacies evoke the notion of inclusion (Warschauer and Tate, 2017). However, little is known about how newer literacies of students with autism may be situated within the context of New Literacy Studies.

What is the autism spectrum?

The autism spectrum is a neuro-developmental condition characterized by two main diagnostic criteria: (i) persistent challenges of social communication and (ii) restricted and repetitive patterns in interests, activities, or behaviors (Bishop et al., 2013). The prevalence rates in students diagnosed on the spectrum have increased over the past decades (Australian Bureau of Statistics, 2020; Centers for Disease Control and Prevention, 2020). Given this increase, a timely synthesis of knowledge and understanding about the relationship between literacies and social communication for this population of students is needed.

The autism spectrum: embracing New Literacy Studies

There is a role for understanding literacies for students on the autism spectrum that is informed by New Literacy Studies. Gee (2007) argues that literacy is not unitary but is multiple because distinct types of literacies are needed to read, interpret, and write various types of texts. From this perspective, we acknowledge students on the spectrum may have different ways of approaching communicating, reading, writing, and acting with texts. Students have multiple means of feeling, interacting with, and developing knowledge as they engage in social practices with various print and literacies in online and offline contexts (Street et al., 2017). It is therefore important to consider New Literacy Studies as a way to support the inclusion and diverse literacy practices for students on the autism spectrum. With the growing number of students on the spectrum (Christensen et al., 2016), it is important to develop inclusive frameworks for engaging students in literacy education and supporting their social communication.

Autism, literacies, and social communication

Educators need to make connections between literacies in social practices that are situated across diverse physical and virtual spaces, and informal and formal learning environments (Alvermann and Robinson, 2017; Feiler et al., 2007). New Literacy Studies enable understandings of how bridges can be built among conventional literacies, home literacies, school literacies, and online and offline social contexts. To date, a large body of autism researchers have focused on conventional literacies and literacy skills for students with autism within formal education contexts. For example, the relationship between levels of autism, students' emergent-literacy skills, and decoding abilities have been subjects of investigation (Clendon et al., 2021; Dynia et al., 2017; Hume et al., 2020; Jacobs and Richdale, 2013). Researchers of emergent literacies and autism have considered students' receptive language demands, and factors in physical environments when trying to assess students' verbal communication skills (Clendon et al., 2021; Kwok et al., 2015). Autism research within New Literacy Studies may enhance understanding of how digital technologies such as computers can be used to target and teach literacy skills such as reading and writing of letters, syllables, words, sentence construction, sentence imitation, verbal expression, phonological awareness, spelling, and receptive identification and matching of pictures and vocabulary words (Ramdosset al., 2011).

Student literacy profiles and autism

Students' literacy profiles, comprehension abilities, academic knowledge, reading abilities, and receptive, expressive, and written language, and communication skills are also considered important areas of literacy focus in autism studies (Bailey et al., 2017; McIntyre et al., 2021). Literacy profiles of students with autism have been conceptualized along a continuum of diverse adjustments where learners may receive comprehensive support, intensive support, moderate support, or limited support for conventional literacies and school literacies (Hume et al., 2020).

Characteristics of home literacy and autism

Researchers of conventional literacies and literacy skills have also investigated characteristics of home literacy and home literacy environments in students on the spectrum (Dynia et al., 2014; Lucas and Norbury, 2018). Home literacies are essential to access educational curriculum, and are associated with educational attainment, independent reading, variations in reading ability, oral

language ability, strength and weaknesses in letter name identification and print functions, parental encouragement and scaffolding, and parent-child engagement (Lanter et al., 2012; Lucas and Norbury, 2018). Home literacy strengths and challenges of students on the spectrum have been addressed through shared book-reading practices and interventions (Fleury et al., 2021).

Educators are urged to discern how home literacies can be aligned with classroom literacies and used as pedagogical tools to achieve learning outcomes (Lucas and Norbury, 2018; Yeh and Mitric, 2020). It is inferred that, if schools have a tendency to value and promote only their own perspectives of literacies, then the exclusion of out-of-school and home literacy practices across families of students on the spectrum may restrict student literacy and social communication development (Feiler et al., 2017; Vigdor et al., 2014). New Literacy Studies provides a context for broadening understanding of students' social practices, literacy profiles, and literacy skills that are situated across diverse formal and informal learning environments.

Literacies and social communication: closely related constructs

Social communication, a key area of challenge for students on the spectrum, includes direct human engagement and contact with others during physical or virtual play and verbal exchange (Chen and Tsai, 2016; Hughes et al., 2013; Locke et al., 2016). A growing body of autism research shows that social communication and literacy development, interactions in literacy events, and literacy experiences are intertwined and closely related constructs (Ricketts et al., 2013). Social communication skills facilitate critical thinking, discussions, collaboration, and presentations through the use of grammar, figurative language, and vocabulary (McIntyre et al., 2021). Autism scholars have focused on how students communicate with each other within specific contexts and across time and space and through various literacies (Vasudevan et al., 2018; Warschauer and Tate, 2017).

More specifically, the link between social communication and literacies have been shown through studies that focus on shared reading with adults who allow students on the spectrum to develop social communication through engagement in acts such as vocabulary building abilities, listening, uttering, inference, commenting, expressing, comprehending, asking questions, and promoting interaction (Bean et al., 2019; Boyle et al., 2019; Fleury and Hugh, 2018; Fleury et al., 2021). The relationship between literacy skills such as decoding skill and comprehension and language competence has also been discussed in the research (Lucas and Norbury, 2018). Given the strong link between literacies and social communication, inclusive literacies frameworks could be embraced to develop better understanding of improving outcomes for students with autism who display literacy strengths but who may need individualized supports for social communication (Hume et al., 2020).

Literacy and social communication success and post-school outcomes

Students' literacy success impacts on communication, participation, and well-being beyond formal education years (Westerveld and Paynter, 2021). The long-term social communication, academic, behavioral, emotional, employment, and economic outcomes of all students, including those on the spectrum may be better if they achieve literacy benchmarks (Whalon et al., 2009). The acquisition of social communication and literacy skills are fundamental to developing relationships with others, sharing and receiving information, expressing interests, needs and desires, engagement and participation in important aspects of life including formal and informal education contexts, community, family, relationships, and employment opportunities (Light and McNaughton, 2012). Taken together, the research shows literacy and social communication skills are integral to success post-school years across various content areas and contexts.

By the time students reach high school, they are expected to have achieved basic reading, writing, and comprehension skills and social knowledge (Boyle et al., 2019). A focus on students' achievements, strengths, interest, and motivation may be important for students who are at increased risk of experiencing challenges with the development of literacy skills that are understood to underpin success in social communication (Vasudevan et al., 2018; Warschauer and Tate, 2017). While success in literacy education is critical for all students across early childhood to adolescence, many students with autism may experience more social communication and literacy challenges than their peers (Clendon et al., 2021; Westerveld and Paynter, 2021). Students with autism need to develop social communication skills to limit bullying, peer rejection, loneliness, and to develop friendship qualities, and classroom social networks, acceptance, centrality, companionship, and reciprocity during and after formal education (Carrington, 2017).

Given that students' social communication abilities and successful outcomes may be influenced by literacy activities, students who have limited social communication skills may benefit from participating in literacy activities with instructional support (Kluth and Chandler-Olcott, 2008). The closely related constructs between literacies and social communication as well as challenges that students on the spectrum may face, suggest it may be preferable to embrace inclusive frameworks that have implications to support them to successfully develop their strengths and a repertoire of social communication skills as they continue to engage with high-interest literacy practices across diverse formal and informal educational contexts.

Autism and literacy challenges: medical and social perspectives

The literacy challenges of students with autism has been researched and understood from a clinical and medically based perspective and through the social model lens of disability (Waltz, 2013). Attention is drawn to the medical versus social model perspectives of autism and literacy challenges to highlight the need to build an inclusive literacy framework.

Medical model perspective: framing literacy challenges

Within autism research, literacy challenges for students on the spectrum have been linked with delays in early literacy skills such as decoding, phonological processing, and reading comprehension, and challenges with verbal language skills and expressive and receptive language (Boyle et al., 2019; Davidson and Ellis Weismer, 2014; Kwok et al., 2015; Tager-Flusberg and Kasari, 2013; Westerveld and Paynter, 2021). From a medical perspective, challenges in literacies may be associated with factors such as impact of autism traits, students' lack of social understanding, limited social communication skills, and restricted interests and repetitive behaviors (American Psychiatric Association, 2013, see also Ricketts et al., 2013). Challenges with coexisting intellectual disabilities (Westerveld et al., 2020), theory of mind (see for example, Baron-Cohen, 2000; Baron-Cohen et al., 2013; Westerveld and Roberts, 2017), and executive functioning (Lai et al., 2017) have also been linked with literacy challenges for this cohort of students.

Jordan et al. (2010) argue that a medical perspective can guide understandings that literacy skills of learners on the spectrum are affected by their learning styles, intellectual abilities, personalities, and patterns of weaknesses. Humphrey and Lewis (2008) support the view that students are sometimes segregated, embarrassed, or ignored, and subjected to unnecessary exclusion where literacy education is heavily influenced by an autonomous model of literacy and the medical model of disability. A deficit perspective may result in students being excluded from literacy opportunities and denied resources to acquire and develop these skills (Keefe and Copeland, 2011). This paper embraces New Literacy Studies to build an inclusive framework for understanding literacy skills, strengths, and challenges experienced by students on the spectrum.

Social model of disability: embracing students' strengths and interests

Despite medical perspectives of literacies, much of the inclusive education literature embrace the fundamental principle of inclusion that supports diversity and promotes the notion that all learners have valuable practices, strengths, individual differences, and social and cultural backgrounds for literacy classrooms (Carrington and MacArthur, 2012; Comber, 2007; McIntyre et al., 2011; Tomlinson and Imbeau, 2010). Using the perspective of a social model of disability, literacy models that emphasize the skill deficits students may experience are being rejected (Waltz, 2013). Instead, the social model of disability enables a focus on building on students' strengths and abilities rather than the perspective that literacy challenges result from the characteristics of autism spectrum and are innate to the students (Durell, 2014; Patel et al., 2014). A social model of disability requires inclusive frameworks in education with multiple approaches to literacies informed by collaboration with a range of stakeholders, optimization of assessment processes, and a thorough knowledge of students' literacy profiles including their interests, strengths, and needs, and prioritizing adjustments and supports (Clendon et al., 2021; Winter-Messiers, 2007).

Social model of disability: illuminating and removing literacy barriers

Through a social model of disability lens, barriers for literacy education are socially, institutionally, and environmentally constructed (Oliver, 2013; Woods, 2017). Through this lens, Disability may be perceived in literacy education to result from factors such as the persistent attitudinal barriers of others in the educational environments, societies, and communities that restrict students from fully, equitably, and effectively learning, engaging, and participating with others. Other factors that may contribute toward a literacy disability are inadequate resources, funding, and opportunities to promote interactions and learning.

Students can develop literacy skills when educators remove barriers, understand students' strengths, provide learning opportunities, and develop in-depth assessments to inform literacy instruction (Clendon et al., 2021). Supporting literacy inclusion for students on the autism spectrum (who may be at risk of experiencing challenges with the development of literacy skills and may perform slower and lower than their typically developing peers in literacy areas) requires identify and removing barriers to literacy learning (Wei et al., 2011, 2014). For example, social, economic, and physical barriers to literacy education need to be identified and removed in virtual spaces to enhance opportunities for social communication (Gee, 2015). New inclusive frameworks within New Literacy Studies may broaden understandings of barriers that students on the spectrum face in online and virtual contexts and how students can be supported through inclusive practices, that target their interests, strengths, and needs.

Supporting inclusion of students on the autism spectrum through new literacies

Newer definitions of literacies for students on the autism spectrum have shifted from instructional practices and discrete skill instruction to more inclusive approaches that acknowledge potentials incorporated in online practices (Stone, 2018). Literacies for students on the autism spectrum now means acknowledging the challenges students may experience and support in an integrated way their abilities, strengths, skills, and competencies to motivate students to view, read, write, speak, listen, design, and construct meaning from electronic texts and information and communication technologies in independent, collaborative, and appropriate ways (Baynard, 2010; Stone et al., 2018, 2019). Consideration of how the use of new literacies can be maximized to support inclusion of students on the autism spectrum, and other diverse learners to meet their targeted goals and achieve their optimum levels of educational outcomes is needed (Barr et al., 2008; Boche and Henning, 2015).

Literacies: online, digital, and multimodal social communication

The New Literacy Studies has broadened perspectives that literacy practices in online virtual settings are linked with new ways of social communication (Gee, 2015; Garcia, 2017; Ito et al., 2009; Peters et al., 2013; Quandt and Kröger, 2014). Many students are active participants in social communication processes through digital literacies as opposed to being passive recipients of knowledge, who are taught that they need to develop and use social communication skills in physical contexts, such as classrooms and playgrounds (Beavis, 2014; Locke et al., 2016). Many students' social communication has expanded from physical contexts to virtual contexts, and from a reliance on language to using digital tools, game engines, and virtual worlds that are created by game designers (Gee, 2015b). Improvements in literacies are also associated with opportunities that students have to communicate with each other through the use of new technologies, such as online computer activities (Genlott and Grönlund, 2013; McCreery et al., 2015). Therefore, there is now increased recognition that social communication is an essential process that should be integrated into literacy education through digital media platforms such as: video games, Email, music video, smart phone, and social media (Light and McNaughton, 2012).

Autism research: social communication beyond physical contexts

Until recently, much of autism research into students' social communication and literacy skills has focused on students' verbal communication skills in physical contexts. In the past, challenges with social communication skills in students with autism have been manifested, observed, and assessed in physical contexts such as through physical and verbal face-to-face play in physical environments and between peers (Peters et al., 2013). Similarly, challenges with social communication and literacies have been associated with students' speech, language, and sensory perception (Clendon et al., 2021; Westerveld and Paynter, 2021). However, a greater understanding of students' proficiencies is needed beyond their spoken language because when students on the spectrum display social communication needs and limitations within narrow definitions of literacy, they may become marginalized. Newer understandings of literacy practices and social communication are necessary to move beyond physical contexts, and medical and conventional perspectives.

Notions of social communication are expanding in unprecedented ways through digital and virtual spaces and screen-based literacy texts to include forms of literacy practices (Garcia, 2017; Ito et al., 2009; Peters et al., 2013). These notions need to be embraced on a wider scale for students with autism. The continued development of inclusive education, technologies, and digital communication give rise to an increased number and types of contemporary digital practices, literacies, and online and virtual environments that serve as platforms for students on the spectrum to acquire opportunities and skills to socially communicate. For example, Zhao et al. (2021) found that cognitive training based on virtual reality was very appealing to students on the spectrum and that within this context students' social communication and speech improved.

All students need to be given opportunities to practice, generalize, and transfer essential skills beyond virtual environments, across different contexts with different people, and in different activities, until eventually they develop proficiency (Cope et al., 2000; Gee, 2015; Rivalland, 2004). Opportunities and platforms to develop social communication skills in online and virtual environments may enable students on the spectrum to benefit from digital technologies in their development of social communication and literacy skills without the unpredictability and challenges of physical-world and face-to-face interactions that could result in increased anxiety. The New Literacy Studies is embraced to broaden understanding of students' literacy proficiencies and needs, adjustments, and differentiated support considerate of and responsive to students' diverse social communication needs beyond physical contexts (Clendon et al., 2021; Fleury et al., 2021; Foreman and Arthur-Kelly, 2017; Hume et al., 2020).

Literacies and multimodal social communication

A 21st century description of literacies acknowledges and embraces students' ability to use modes of communication in a variety of contextual forms for social communication (Alvermann, 2009; Tompkins, 2014). Improvements in literacies are associated with multiple contexts and opportunities where students have to socially communicate with each other through new modes of instruction (Genlott and Grönlund, 2013; McCreery et al., 2015; Street et al., 2017).

Researchers have shown links between students' online literacy practices and their development in social communication (Merchant et al., 2014). Multimodal approaches to literacies and social communication allow students to gain meaning and communicate in the widest sense through—visual, oral, gestural, linguistic, musical, kinesthetic, and digital ways (Alvermann, 2009). Nonnis and Bryan-Kinns (2021) agree and have proposed methodological approaches that embrace diversity and promote designs to support students' use of music in favorable environments to spontaneously socially communicate and engage with peers. Given that students have a diverse range of needs, they should be supported through a multiplicity of social communication modes, such as speech, writing, gestures, images, and sounds. Multimodality is defined as the combination of resources for multiple semiotic resources of meaning making and communication (Kress, 2017).

Autism and multimodal approaches to literacies and social communication

As some students on the spectrum engage in various online digital media and digital texts, an inclusive framework within New Literacy Studies should be encouraged to broaden understanding of their interests in a range of social communication modes which

facilitate literacy and social communication development. Recently, concepts of literacies and social communication for students on the spectrum have become attached to the theory of multimodality (Stone et al., 2018, 2019). New literacies for students on the spectrum encompass digital acts of social communication that combine speech, gaze, sound, gesture, facial expression, intonation, and body positioning. Findings from Nonnis and Bryan-Kinns (2021) revealed that interactive technology can be used by students on the spectrum as opportunities for social communication through eye-contact, turn-taking, sharing of objects and space. Social communication for students with autism has also been researched through arm and hand movement (Braddock and Hilton, 2016), image such as illustrations and drawings (Peters et al., 2013; Rogers, 2013), gesture (Dindar et al., 2016), touch (Gentry et al., 2015), body posture (Doody and Bull, 2013), body movement (Lucas and Norbury, 2018), body language (Peterson et al., 2015), speech (Katz and Girolametto, 2015), writing (Asaro-Saddler, 2014; Caron, 2016; Geither and Meeks, 2014), and sound (Boddaert et al., 2004; Russo et al., 2009). These findings confirm consensus among researchers that students now use a wider range of social communication modes and express themselves through the multimodal symbols available to them within their online, virtual, and digital literacy engagements more than they used to.

Autism researchers have continued to seek multimodal ways to understand social communication in the literacy practices of students with autism. Multimodal elements in virtual worlds have been used as realistic platforms and tools for enhancing social communication for students on the spectrum. For example, a study by Finke et al. (2015) highlights that during video game play, students with autism use diverse social communication modes such as speech and/or vocalizations, gestures, tapping tablet or smartphone, sign language, communication board or book, picture exchange communication systems, and computer with speech output.

Although many students on the spectrum may have a desire to socially communicate through the use of digital technologies, they may experience challenges interpreting meaning from verbal and nonverbal social communication modes such as interpreting facial expression, gesture, and body language (Atkinson, 2009; Bekele et al., 2013; Doody and Bull, 2013; Kaartinen et al., 2012). Considering the importance of multimodal online and virtual literacies for social communication proficiencies and success, the New Literacy Studies is important to inform research into online multimodal literacy practices of students with autism.

Inclusive literacies and autism: video games

There are many digital literacies that students on the spectrum engage with but for the purpose of this paper, video games, such as those played in online multiplayer gaming contexts will be the focus. Video gaming is defined as the use of specific game systems, through digital devices such as computers, tablets, and cellular phones, where players experience entertainment and enjoyment as they engage alone or in the company of other players (Finke et al., 2015). These digital texts are sophisticated literacy practices that are part of the popular culture of students (Beavis, 2014; Gallup et al., 2016; Stone, 2018).

Social communication through literacies of video games

New Literacy Studies have influenced interest in the way students' literacy and social communication are shaped by video gaming. Newer understandings of literacies have enabled broadened ways of defining the contemporary and evolving nature of social communication through students' interests in video games. The gap in autism research and the New Literacy Studies literature draws attention to the need for a conceptual framework to better understand and describe the video gaming literacy practices of students on the spectrum and to address students' social communication strengths and needs within an inclusive context.

Autism, social communication, and literacies of video games

A study into the prevalence of screen-based media use among youths with autism suggests that the majority of youths on the spectrum (64.2%) spent most of their free time playing video games (Mazurek et al., 2012). Students with autism have been reported to use their interest in video gaming to have conversations with their peers about video gaming, and consequently show improvement in communication skills (Winter-Messiers, 2007). In the study reported by Gallup et al. (2016), the researchers explored aspects of social communication in socialization of adolescents with autism who engaged in multiplayer online role-playing games. The participants reported that they preferred the ease with which they could talk with other gamers through virtual medium that facilitated communication through voice talk. The findings from this study suggest video games that are played online by students on the spectrum provide platforms and opportunities for students to engage in conversation and build social connections with peers, friends, and unknown players in virtual communities.

Students on the spectrum may use sophisticated digital literacy and social communication skills to enthusiastically seek out others to actively work together and proficiently solve complex problems within the game context (Gallup et al., 2016). For example, Stone et al. (2018, 2019) investigated how social interactions within online multiplayer gaming contexts provide opportunities for students with autism to socially communicate and collaborate with online gamers, and to talk about digital creations in classroom and virtual world spaces. Similarly, findings from the study of Finke et al. (2015) revealed that students on the spectrum talked about playing video games with familiar partners, unknown people, and valuable friends and engaged in social communication through positive social experiences. The authors encourage professionals to consider how videogame play may be used to build and teach new social communication skills to students on the spectrum. Findings from these and other studies suggest an

increasing number of students with autism are likely to prefer online multiplayer gaming as opposed to engaging in physical play with peers or offline single player gaming (Gallup et al., 2016; Kuo et al., 2014; Lucas and Norbury, 2018; Mairena et al., 2019; Mazurek and Wenstrup, 2013; Stone et al., 2019). Further connections to New Literacies Studies are relevant in showing that the interests of students with autism to socially communicate permeate their literacy practices beyond the boundaries of physical spaces, to include digital contexts such as video games (Marsh et al., 2016; Richards and Burn, 2014).

Social communication and literacy motives and benefits of video gaming

Literacies of digital games such as Minecraft are useful to motivate student engagements in social communication through literacy learning opportunities (Marcon, 2013; Marcon and Faulkner, 2016). To illustrate further, research by Mazurek et al. (2015) suggests video gaming may provide opportunities for students with autism to enjoy reading game stories and commentaries on certain issues and story elements of fantasy and adventure. A study conducted by Finke et al. (2018), shows students on the spectrum can be attentive to social communication during video gaming, and develop literacy skills such as writing, speaking, reading, and spelling. Researchers have also observed during a brief group intervention for students with autism, teaching sportsmanship skills through video games and video-gaming technologies facilitate learning of social communication skills (Ferguson et al., 2013).

Social communication benefits through video game design have also been the focus of research. Video games have been designed to help students on the spectrum construct, recognize, and follow emotions through 3D avatar facial expressions (Abirached et al., 2011; Finke et al., 2017). Terlouw et al. (2021) developed a multiplayer virtual escape room to facilitate direct and playful social communication between students on the spectrum and their peers. Ben-Sasson et al. (2013) found that games with a technological touch increased positive social communication for students on the spectrum. There is a gap in the New Literacies Studies for building on these findings and enhancing understandings of social communication for students with autism, through video game design.

Unique literacy and social communication benefits and motives of engaging with video games play include personalized learning, social initiation, creativity, story design, and social connection (Finke et al., 2018; Gallup et al., 2016; McEvoy, 2016). Likewise, social communication in virtual environments of online video gaming is a necessary part of a healthy lifestyle to help students on the spectrum overcome anxiety and stress and limits the chance for social isolation, and feeling depressed and lonely (Gallup et al., 2016). Social communication in game play for students on the spectrum may be influenced by factors such students' age, expressive communication abilities, and social awareness (Ben-Sasson et al., 2013). Given these benefits and motives, the New Literacies Studies is considered useful to better understand potentials of video games for the literacy and social communication of students on the spectrum.

Multimodal potential through gaming literacies

Video gaming literacies embody several modalities, with offerings that enable students to navigate virtual spaces, perform actions as gamers, and create and gain specific meanings from communities they socially interact within (Gee, 2015; Quandt and Kröger, 2014; Vance, 2017). Students as gamers combine language, social practices, and multimodal semiotic resources through avatars' actions and the use of conversational and visual literacies (Gee, 2007, 2015). Multimodal potentials of gaming literacies to facilitate social communication between student gamers can also be understood through the games' digital tools such as chat boxes, voice chats, and video chats. These tools hold the potential to support social communication skills through immediate and constant written, spoken, visual, gestural, and aural feedback among players (Cheng and Huang, 2012; Fullen, 2012; Gee, 2015). When video gaming, students' social communication is also influenced by music, in-game sounds, and sound effects heard; and virtual images, gestures, and actions viewed (Lemke, 2017). Students as gamers use these modes of communication to engage in sophisticated dialogs and collaborate to create, socialize, problem-solve, strategize, and engage in ways that may be challenging in face-to-face contexts. As a result, game-based literacy learning has made its way into schools through forms of social communication such as discussions and play (Beavis et al., 2015).

The use of digital and video gaming literacies, such as in online multiplayer gaming activities, provide opportunities for students to socially communicate with each other through a variety of modes (Genlott and Grönlund, 2013). Descriptions of inclusive literacy practices therefore must integrate multimodal aspects of social communication instead of a sole emphasis on behavioral observations and use of verbal communication in physical environments (Quandt and Kröger, 2014). Video gaming technologies and features can support things that are important for social communication with friends and other members of gaming communities with whom students on the spectrum engage (Boyd et al., 2015). This is important to consider within New Literacy Studies as students with autism continue to spend more time engaged with electronic screen media than any other leisure activity (Howard and Patti Ducoff, 2008).

Multimodal potential of gaming literacies for autism

An expansion of video gaming technologies, gaming information, and increasingly globalized affinity spaces means that students with autism are enhancing their abilities to socially communicate with others through new multimodal systems and digital literacies of video games. As gamers, students on the spectrum have demonstrated conscious and simultaneous interpretation of a variety of social communication modes (Stone et al., 2018, 2019). In this context, students cumulatively immerse themselves in conversations

and interactions over extended timescales, through in-game and vocally produced sounds, spoken words, images, written texts, and body movements. To illustrate, key findings from [Hopkins et al. \(2011\)](#) suggest social communication skills may be improved in students on the spectrum through computer-based interactive avatar intervention if students are provided with opportunities to practice attending to eye gaze, recognizing faces and emotions, and discriminating facial expressions.

The review of literature shows that physical contexts do not represent all the literacy and social communication benefits for students on the spectrum through video games such as those played in online multiplayer contexts ([Gallup et al., 2016](#)). Inclusive approaches for students on the spectrum to develop social communication through the literacies of online multiplayer games may include: (i) opportunities for them to design games' elements and mechanics; and (ii) opportunities to display social interaction behaviors, including descriptive behaviors, social smiling, visual contact, and vocalization directed toward game characters and people ([Malinverniet al., 2014](#); [Stone, 2018](#)).

Despite this knowledge, only a few studies have explored how video game play, such as online multiplayer, help foster literacy and social communication skills for students on the spectrum through interactions with peers, friends, and family members ([Mazurek et al., 2015](#); [Terlouw et al., 2021](#)). Although multimodal social communication is a very important area of literacy learning for students on the spectrum, few studies provide a glimpse into the multimodal potential of online video gaming environments to support students' development of social communication skills in inclusive ways ([Stone et al., 2018, 2019](#)). The New Literacy Studies is embraced to draw attention to how video games' multimodal resources support or hinder social communication skills that may ultimately support greater inclusive participation in literacy and successful outcomes beyond classroom walls.

Conventional and functional literacy skills: virtual and informal educational contexts

A vast body of research in New Literacy Studies and autism has examined conventional and functional literacy skills including decoding, encoding, reading, and writing skills in offline-physical environments ([Boyle et al., 2019](#); [Davidson and Ellis Weismer, 2014](#); [Kwok et al., 2015](#); [Tager-Flusberg and Kasari, 2013](#); [Westerveld and Paynter, 2021](#)). Far fewer studies have examined these skills in online virtual environments in formal and informal educational contexts. These skills are important for reciprocal social communication in online digital text-based mediums such as social media that rely on screen text-based communication ([Abirached et al., 2011](#)). Despite research on conventional and emerging literacy skills of students on the spectrum, there remains a relative lack of understanding regarding online and virtual inclusive literacy practices for this population of students. The review of literature has shown that to explore only clinical and conventional assumptions about the literacy practices and social communication of students on the spectrum in physical and offline settings provides a partial and inhibited perspective of autism, literacies, and social communication.

A framework of inclusive new literacies

[Stone \(2018\)](#) presents a conceptual framework for inclusive new literacies that highlights potentials for using digital and gaming literacies such as those of online multiplayer games as inclusive resources within formal educational contexts. The conceptual framework is expanded from a review and integration of research, discourses, concepts, and theoretical assumptions from the fields of New Literacy Studies and inclusive education.

Inclusive new literacies: New Literacy Studies

The field of New Literacy Studies has reflected aspects of access to literacy education and has provided implications to support the social communication of students. Therefore, the framework draws on the digital strand of the New Literacy Studies and builds on the works by theorists within this field of education to highlight the notion students' online literacy practices are often linked to their social communication development which are manifested in virtual and physical environments and online activities and digital contexts ([Gee, 2015](#); [Hayes and Duncan, 2012](#); [Merchant et al., 2014](#); [Prensky, 2007](#); [Richards and Burn, 2014](#); [Street et al., 2017](#)). As [Stone \(2018\)](#) explains, a focus on inclusive new literacies for students on the spectrum is necessary because the New Literacy Studies literature has not explicitly addressed how to remove barriers to literacy learning and participation and how reasonable accommodations could be made for all learners, including students with autism, according to the inclusive educational principles of the *UNCRPD Article 24, Comment Number Four* ([CRPD, 2016](#)).

Online multiplayer games: a model of inclusive new literacies

Online multiplayer games are selected as a model of inclusive new literacies because they are embodied in the realm of many sophisticated literacies that can meet the diverse needs of learners when required ([Beavis et al., 2012](#); [Finke et al., 2015](#); [Gallup et al., 2016](#); [Garcia, 2017](#); [Oakley, 2017](#); [Stone, 2018](#); [Whitton, 2013](#)). Furthermore, describing online multiplayer games as inclusive new literacies, within the context of New Literacy Studies, can broaden understandings of how connections can be made among online and offline social practices, home literacies, and school literacies ([Feileret al., 2007](#); [Stone et al., 2018, 2019](#)).

This notion has not been adequately embraced in the literature despite research indicating that the popularity of online multiplayer games among students, including those on the spectrum has soared over the past two decades ([Beavis, 2014](#); [Nagygyörgy et al., 2013](#)). For example, to date few studies have used an inclusive multimodal framework that examines how the use of online

multiplayer games can develop meaningful literacy and social communication skills for students with autism (Stone et al., 2018, 2019). The increasing interest of students with autism in online gaming and virtual environments (Merchant et al., 2014) raises important consideration for video games such as those played in online multiplayer format to be understood as inclusive new literacies.

Inclusive new literacies: multimodal social communication

The notion of inclusive new literacies is consistent with the consideration that literacy resources can be designed, manipulated, created, and reconstructed across multimodal platforms and multimedia such as those of online multiplayer games to make new meaning and new experiences for social communication (Kress, 2013; Luke et al., 2011). The framework integrates aspects of new literacies, which emphasizes the importance of multimodal social communication in virtual and physical contexts rather than focusing only on the social, academic, symbolic, and face-to-face uses of spoken and written language (Kress, 2017). Within the inclusive new literacies framework, we highlight that as students on the spectrum engage with digital technologies, social communication becomes more complex intensifying the multimodal benefits and challenges they experience. Descriptions of social communication extend deeper than words and physical contact among peers for enjoyment, to include multimodal aspects of online literacy practices, such as through the semiotic resources offered through online multiplayer games (Gee, 2015).

A review of autism literature, literacies studies, and multimodal research (Alvermann, 2009; Beavis et al., 2012; Keefe and Copeland, 2011; Oakley, 2017) provides better understanding of how engagements of students on the spectrum with inclusive new literacies enabled them to gain authentic meanings for social communication through oral, written, visual, gestural, audio, and digital ways. The framework embraces integration of a broad and flexible group of skills, abilities, strategies, and competencies that motivates students to communicate with others for example, through speech, written texts, images, gestures, and sounds within the games' context as students navigate virtual and physical spaces (Finke et al., 2015; Stone et al., 2018, 2019).

Inclusive new literacies: concepts of inclusive education

The framework is also embedded within the field of inclusive education, which contributes recent understandings of autism spectrum, inclusion, literacy education, and social communication for this population of students. The framework draws on social model perspectives of disability, to give attention to students with and without medical diagnoses opportunities, platforms, and support to engage in online and virtual literacies through all available resources and in multimodal ways. As Mitchell et al. (2007) imply, scaffolded support in virtual environments might be achieved through guidance, prompts, and options for appropriate multimodal engagements.

Inclusive education within the framework means barriers should be illuminated and removed, and changes should be made to provide appropriate and necessary resources and adjustments for students to competently participate in social communication and quality literacy experiences in virtual and physical contexts after adult, peer, technological, or virtual guidance is withdrawn. Stakeholders are obligated to provide resources, and differentiated exemplary literacy instructions, and strategies and interventions that suit the diversity in students' strengths, interests, skills, abilities, learning styles, and individual characteristics (Saggers et al., 2011).

Twenty first century inclusion means that all students need resources and opportunities to develop their literacy learning, social communication, and digital capabilities regardless of their medical diagnosis, and cultural, economic, and geographical backgrounds (Oakley, 2017; Price-Dennis et al., 2015). Regardless of the personal, physical, and social constraints to literacies and social communication, supporters for inclusive education have emphasized the importance of providing all students, including those on the spectrum, with environments where their diverse situated literacy experiences and social communication are respected (Ainscow and Sandill, 2010; Carroll, 2015; Malinverni et al., 2014).

The framework supports the notion educators and researchers should divert from the conventional notions that literacy is a mental set of abilities and functional skills that reside in the minds of students, such as those on the spectrum. It argues literacies should be embraced as inclusive currencies to help students socially communicate within various contexts, such as home and school to ensure access to online, virtual, and home literacy resources; making-meaning and continuity in learning within and across inclusive environments (Comber and Barnett, 2003; Lucas and Norbury, 2018; Martini and Sénéchal, 2012). This framework is timely, given that it expands inclusive understandings of the online and offline literacy practices of 21st century students on the spectrum (Reynolds et al., 2011; Stone, 2018).

This paper broadens the original conceptualization of inclusive new literacies with a renewed focus on the alignment of online and virtual literacies and social communication for students with autism (Stone, 2018; Stone et al., 2019). By embracing a newer definition of literacies for students on the spectrum this means the term is not independent of inclusive guidelines, social communication, and virtual and online environments and digital technologies, such as online multiplayer games (Thomas, 2011).

Research recommendations: literacies and social communication

This paper demonstrates that New Literacy Studies has a role in broadening understandings of how students with autism can be supported through inclusive practices for literacy educational success as they engage with digital technologies in virtual worlds. The conceptual framework highlights a gap in the New Literacy Studies literature to make way for digital games and literacy research to build inclusive validity by taking into account strengths and challenges within social practices and online literacies of students on the spectrum (Bossavit and Parsons, 2018). Further research is needed to understand how educators can access students' knowledge,

strengths, and experiences and so build on the literacy skills that students bring from their homes, online literacy practices, and virtual contexts (Bourgonjon et al., 2010; Martini and Sénéchal, 2012).

This paper reviewed pertinent literature around the literacies and social communication of students on the spectrum and presented a conceptual framework of inclusive new literacies to fill a gap within the New Literacy Studies. The framework builds the foundation for continuing research using digital and gaming literacies of virtual environments to support positive social communication outcome of students on the spectrum. Future research within the fields of New Literacy Studies and inclusive education must address benefits, barriers, and challenges students on the spectrum experience in virtual contexts so up-to-date conceptual frameworks and approaches can be implemented to improve their social communication and better meet the social communication needs for this population of students. Although the research shows that video games embody many literacies and modes for social communication further research is needed about how other digital and virtual literacies align with and influence inclusive notions of social communication for students with autism.

Introduction

This article explores the tensions between disciplinary literacy and content area literacy by considering where the field of adolescent and college literacy should go given dramatic and fast moving technological elements, societal demands to address big questions (e.g. climate change), and the changing nature of learning. We start with a vignette set in 2030 inspired by the research of futurists (Diamandis and Kotler, 2020) and others. Following this look into the future of teaching and learning, we take up a brief history of disciplinary and content area literacy, along with a look at current research in the area and a critique based on efforts to envision what students in the future are likely to experience as they acquire transdisciplinary capital (Crow and Dabars, 2020).

Vignette

You teach high school environmental science in a collaborative core team of other faculty at your school from mathematics, history, English, art, music, and computer science as well as dedicated staff to help with technology innovation. The year is 2030 and big problems ranging from climate change to plastics pollution are on your and your students' radar. Today, you are heading to the Brock Environmental Center on the Chesapeake Bay where you and your students will learn more about the Great Pacific Garbage Patch plastics pollution, and inventions aimed at ameliorating these environmental threats. "Entitled Plastics and Microplastics: A Pressing Global Issue," today's workshop will prompt your students to think creatively about possible ways to change their dependence on plastics. One of the early inventions to capture plastic waste from the Great Pacific Garbage Patch, where 1.3 trillion items of plastic drifted between Hawaii and California, was created by a 25-year old Dutch entrepreneur, Boyan Slat. He envisioned a huge floating barrier that could use the ocean's current to corral plastic waste. You are excited to see what newer inventions are being created to reduce pollution from plastics.

Your electric, autonomous self-driving vehicle arrives from its down town parking garage to transport you to the Center as you drink your morning coffee and enjoy the view of the Lynnhaven River in Virginia Beach. Your ridesharing car is 80% less expensive than owning a vehicle and that's allowed you to purchase a condo. Unlike your college dorm room, your condo is quiet, well equipped with technology for creating lessons and units that students find engaging. You know that many of your students come to school from families struggling to make ends meet, juggling multiple jobs, and trying to carve out time and space to read and talk about their kids' interests. Fortunately, schools have embraced transdisciplinary curriculum where faculty core teams create lessons that center on questions students generate in relation to their lives that span poverty, health care, adequate housing, and

a host of other issues. These social issues are a huge part of the curriculum and today's field trip is centered on possible futures in an environment that is increasingly threatened.

The Brock Environmental Center is a model for other construction projects aimed at being sensitive to increasing threats from sea level rise and ecological extinction of many species. Constructed 16 years ago, the Center is a vanguard for green construction. At 10,000 square feet, it is fully independent and off the power grid. The rooftop photovoltaic solar panes generate 60% of the Center's energy needs and wind turbines add the remaining 40% needed to operate the Center. Rain cisterns capture and filter water for drinking and composting toilets provide human waste for rain gardens. The building itself rises 14 feet above sea level so that it may stay dry during flooding.

Most importantly for your students today, mini-courses like the one on plastics pollution encompass earth science, biology, history, art, English/writing, math, chemistry, civics, economics, government, computer science, and responsible citizenship. Environmental restoration projects include oyster, wetland, and other habitat restoration. You think, yeah, this will be a good day and a great launch pad to engage your high school students in creative ways to tackle some of these issues.

As your 20 min ride to the center continues, you daydream about your students having access to large data sets that chart trends in plastics production, use, and disposal in real time. Drawing from their understandings of data science, your students can then evaluate the extent to which scientists' current methods of measuring plastics and their impacts is adequate after learning that previous methods of measuring microplastics underestimated their presence by five to seven orders of magnitude (Brandon et al., 2020). Your students can document and reflect on their own plastics usage and compare it to that of other people. They can develop high-leverage solutions to the problem, such as through engineering new packaging for food transportation and storage rather than plastics. They could make art and spoken word poetry to engage the community in the issue. In addition, they could create multimodal narratives that move hearts and minds.

The future forecast

In the vignette set in 2030, global issues including pandemics, climate change, sea level rise, destruction of ocean coral reefs, and a host of other problems have shifted the ability of individual disciplines to tackle these complex problems. Rather, transdisciplinary teams are already reconfiguring how students and faculty organize to be able to tackle dynamic problems. "Novel transdisciplinary configurations represent institutional experiments that can recalibrate the course of inquiry and engage the application of research" (Crow and Dabars, 2020, p. 369).

At the school site level, newer school buildings are designed with collaboration in mind, as well as project based elements (e.g. gardens, rain catchment, ponds, and areas to observe these features). The expectation is that out of this transdisciplinary curriculum, new theories and practices will emerge to address global challenges. "Our collective survival as a species may be contingent on our capacity to collaborate across disciplinary boundaries" (Crow and Dabars, 2020, p. 383).

Now that we have taken a brief look into the future of education, we are going to backtrack a bit to consider where we have been in the realm of adolescent literacy and some of the tensions that appear in arguments favoring disciplinary literacy and content area literacy. In the vignette, our environmental science teacher is part of a transdisciplinary core team at the high school, collaborating across disciplinary silos in 2030. But, as we will see, this process is already underway and badly needed given a multitude of challenging world problems such as COVID-19.

A brief history and epistemological issues

Disciplinary literacy and content area literacy

As we think about learning and knowledge acquisition in content area classrooms, a key issue is the particular epistemological stance adopted by a teacher and students. In essence, some classrooms treat knowledge as a set of factoids to be covered and regurgitated. This is unfortunate because we are then in danger of developing future citizens who may well be able to survive shallow high stakes tests while unable to creatively tackle challenging global problems (Bean and Dunkerly-Bean, 2016).

In the next section we define disciplinary literacy and content area literacy and include some examples that illustrate these practices in action. Both are important as students navigate an increasingly complex array of text forms that include traditional print and, increasingly, multimodal forms including video, podcasts, virtual classrooms and beyond.

In disciplinary literacy "students use literacy to engage in goals and practices that are unique to each discipline" (Wilson-Lopez and Bean, 2017, p. 3). For example, in history students can evaluate the truth value of historical information across multiple sources.

In content area literacy, "Students learn reading and writing processes that are common across disciplines" (Wilson-Lopez and Bean, 2017, p. 2). For example, taking notes on a text or video, creating a graphic organizer of key ideas in a content area reading assignment, and other general meaning making approaches are ones that can be applied to a variety of content areas.

In the sections that follow we provide some examples of both disciplinary literacy and content area literacy practices.

Examples of disciplinary literacy in practice

Disciplinary literacy recognizes and capitalizes upon the particularities and discourse elements of various fields (Wilson-Lopez and Bean, 2017). For example, the particular ways in which an environmental scientist studies oceanic reefs, threatened with extinction, provides a model for reading and writing about how an expert might address looming environmental problems.

Reading in science as a discipline focuses on reading across multiple forms of texts including graphs, data charts, observational field notes, as a host of Internet based information (Greenleaf and Hinchman, 2020). Inquiry in science acknowledges its tentative nature as new information is discovered. In the classroom, this means that students need multiple opportunities to discuss readings and navigate multiple text forms to study issues like water pollution deeply.

Mathematics literacy practices uses formulas, graphs, symbols, and algorithms to engage students in tackling real life problems (Enderson and Colwell, 2021). For example, staghorn coral reefs in the Bahamas are dying off. At what rate is this happening and what are the possible causes of this movement toward extinction (e.g. climate change) (Trammell, 2018)? By using the Internet and applying mathematical literacy approaches to real life inquiry, students can use mathematics these tools in problem solving and discussion of possible solutions.

Many recommendations regarding disciplinary literacy have been developed based upon studies of professionals within disciplines, such as history (Wineburg, 1991), English language arts (Rainey, 2017), or physics (Bazerman, 1985). These studies have indicated that disciplinary practitioners interpret and evaluate texts using discipline-specific frameworks, and they use these texts in the context of discipline-specific knowledge construction practices. By implication, within each discipline, students can gain practice in interpreting and evaluating texts using disciplinary frameworks, and they can use these texts to solve problems or generate knowledge using methods practiced by professionals in those disciplines.

Examples of content area literacy in practice

Instead of emphasizing the interpretive frameworks and practices that are specific within a single discipline, content area literacy offers an array of strategies (e.g. graphic organizers) that compliment and increase the various concepts students encounter in multiple fields including history, mathematics, robotics, artificial intelligence, virtual reality, engineering, English, art, music, computer science and so on. While there have been debates comparing and contrasting the advantages and disadvantages both approaches offer teachers, Wilson-Lopez and Bean (2017) note that: "Content area literacy and disciplinary literacy are not mutually exclusive approaches to literacy instruction" (p. 5). Rather, traditional approaches such as notetaking, recording lectures for later study, creating graphic organizers and summaries of longer articles are all within the realm of content area reading practices. Thus, both disciplinary literacy and content area literacy can be mutually supportive of students' learning.

In an effort to shed light on the state of content area literacy amid increasing calls for attention to disciplinary literacies, Collin (2014) used Basil Bernstein's theory of the pedagogic device to deconstruct arguments for both approaches. Bernstein's research examined the sociology of school knowledge that revealed that discourses were recontextualized as they moved from one field to another. For example, the character of a discourse in one context (e.g. university level biology) is transformed when it is applied in a different context (e.g. high school biology). Collin notes: "Each effort to reset distributive rules is shaped by ideological beliefs about what schools should do for whom and why (p. 314)". In essence, in high school, students may well balance university like biology concepts with science issues applied to everyday life. In essence, a blended version of content area and disciplinary literacy are in operation in this context. And, as we noted earlier, content area literacy and disciplinary literacy are not mutually exclusive domains.

A brief history—some caveats

Nevertheless, as we write this an increasing number of studies and articles center on the unique dimensions of various disciplines, staying on a course that keeps disciplinary literacy in disciplinary silos (Dunkerly-Bean and Bean, 2016). If we compare disciplinary literacy and content area literacy, disciplinary literacy is the new kid on the block in terms of research exploring its ongoing contributions. Content area literacy influenced our field as far back as the early 1900s with an emphasis on approaches to reading and studying in the disciplines (Moore et al., 1983). During the 1970s, Hal Herber published the landmark textbook, *Teaching Reading in the Content Areas*. Hal Herber's doctoral students at the Syracuse University Reading and Language Arts Center published a series of research monographs that explored various reading strategies including a substantial body of work on graphic organizers (see Barron, 1969; Moore et al., 1983). For a more complete history of both content area and disciplinary literacy (see also Dunkerly-Bean and Bean, 2016).

In a compendium of nearly 50 years of literacy research across the disciplines, Scott et al. (2018) conducted a systematic analysis of trends spanning 1969–2017. The time frame of this body of work encompassed pivotal documents including the 1970 publication of Harold Herber's landmark textbook, as well as the National Assessment of Educational Progress (NAEP). In all, these researchers began by examining 3413 articles and their abstracts, paring this down to 53 studies that met key criteria, and ultimately arriving at 29 studies that seemed to impact the field. Not surprisingly, emergent themes included teachers' perceptions that supported the integration of content area literacy practices, as well as reported resistance to doing so. The researchers pointed to the need for additional research mapping writing within the disciplines.

Rather than rehash academic debates surrounding content area and disciplinary literacy, we want to focus this analytic argument on an increasing body of research in disciplinary literacy. In addition, we add a look at the future of disciplinary literacy from ongoing research in future studies that pay close attention to the fields of Artificial Intelligence, Robotics, and the increasing use of technology to rapidly cull information in high-speed searches.

Indeed, as we are writing this the challenges of living with a global pandemic, racism, and many peaceful protests in support of #BlackLivesMatter, along with calls for police reform occupy the news. In addition, families are home schooling children, managing online learning, and balancing their own efforts to return to jobs where they have been laid off or furloughed. Thus, while we ponder the future it is in a context where the unknown looks toward a vaccine and a possible future that is just and peaceful. Toward that end, a significant body of extant research helps inform our practices in disciplinary literacy.

Ongoing research in adolescent disciplinary literacy

An ever-expanding body of research is providing a better understanding of various epistemological approaches to disciplinary literacy.

Project Based Learning

Project Based Learning (PBL) offers an epistemological approach that provides space for students to tackle pressing problems like pollution and environmental issues (Wurdinger, 2016).

For example, Windschitl (2019) reported on 12 years of research with biology teachers aimed at transforming teacher-centered discussions into student-centered, face-to-face deliberation around scientific data. To make this work clearer, the following hypothetical example illustrates how students might engage with multiple disciplinary literacy practices while exploring the environmental problem of an invasive species.

Nutria, a large, herbivorous, semiaquatic rodent occupy wetlands where they eat and destroy marsh grasses that shelter areas from erosion. They were originally brought to the United States in the late 19th century to be raised for pelts. When that business failed, they were released into local waterways. If students in Baton Rouge, Louisiana were studying research about an invasive species like Nutria they could first view a YouTube clip providing a visual display of Nutria eating away at the grassy area of a watershed, and visit a local watershed to collect data related to the destruction of the landscape, and compare these data with local ecologists' data. In addition to YouTube clips, students could consult texts that talk about the Nutria's role in wetland erosion.

In accordance with Windschitl's recommendations, the students would hold vibrant discussions in the context of explaining phenomena, gathering known facts and data, and drawing from their everyday knowledge (e.g. Nutria do not attack people and they are nocturnal feeders). In this curriculum model, students are expected to use source material (including online searches), to challenge competing ideas, find evidence and defend their knowledge to other students, and, ultimately, build and evaluate collective knowledge and methods relative to problems of importance (e.g. evaluating wildlife biologists' solutions for eradicating nutria).

In thinking about curriculum design in the academic disciplines, Deng (2013) argued that it is far too easy to center students' efforts on concept learning devoid of sociocultural dimensions. "Curriculum development framed by this approach ignores the interests, attitudes, and feelings of learners" (p. 42). Deng especially worried that issues of social reform will be left out of disciplinary literacy. A learner-centered approach may be preferable to a disciplinary approach in Deng's view.

A learner centered approach

A good example of this stance is a middle school social studies unit that takes a social justice focus where middle school students explored their own local history via multimodal complex text sets (Kucan et al., 2019). The unit focused on events related to the Hill District in Pittsburgh, Pennsylvania set in the 1930s and 1940s. Two 8th grade social studies teachers engaged their students in an exploration of the Hill District neighborhood, a vibrant African-American community. It was often called "Little Harlem" because of its rich cultural offerings, but in the 1960s urban renewal destroyed the neighborhood to make room for a Civic Arena. A new highway was constructed that effectively cut off the neighborhood from downtown.

Students were able to consult an online digital repository to study the Hill's history and ultimate demise. This research helped them understand current race relations, economic conditions, and housing conditions in the present day. During the course of the 15-lesson unit, students read primary source material and raised their own questions about the Hill, then and now. Their multimodal projects highlighted the creative ways the Hill residents developed their own businesses and entertainment venues because they were denied access to the downtown businesses. Students discussed and undertook projects illustrating the neighborhood at the peak of its history, offering claims and evidence to support their research. As a culminating activity they argued for a museum that would honor the Hill's rich history. In essence, their voices propelled this research and related projects, chronicling events that were both local and beyond, still occurring in many cities where project housing is being gentrified to make way for urban renewal.

Engineering, too, is a discipline that lends itself to learner-centric approaches wherein youth can imagine new possibilities for their communities and work to effect change. Wilson-Lopez and Minichiello (2017), for example, described middle school youth who sought to improve their communities through designing a safer parking lot for their middle school. Guided by their technology and engineering teacher, they gathered, analyzed, and represented qualitative and quantitative data related to parking lot usage; interviewed community members and other stakeholders in their home languages regarding their experiences; analyzed aerial images of the existing parking lot and used computer-aided drawing (CAD) tools to design new solutions; identified and weighed criteria

and constraints needed for a successful solution; and ultimately used rhetorically powerful images and words to communicate their proposed solutions to a community council after rounds of revision and feedback from their teacher.

While we may imagine that engineers design things with function primarily in mind, the field is much more complicated than that. Cognitive scientist [Norman \(2004\)](#) has spent his life paying attention to how people respond to everyday products (e.g. washing machines). When we encounter a bad design, like a washing machine that leaks, we become angry. In contrast, when an invented object works (e.g. iPhone text messaging), we smile. The problem with bad designs in the machine world is that these flaws frequently cause errors in use.

As suggested by these examples, disciplinary literacy and learner-centric approaches that embrace social reform are not mutually exclusive. On the contrary, youth can use disciplinary practices (e.g. analyzing a variety of primary sources to determine multiple perspectives), as well as more generalizable content area literacy strategies (e.g. revising word choice based on feedback), as tools for addressing social issues of personal, local, and global significance. Literacy pedagogies, as embedded within different content areas, can support youth in using disciplinary lenses and approaches, as well as hybrid approaches that cross disciplines, as well as community and school boundaries. Increasingly, the most pressing problems of today and tomorrow demand transdisciplinary approaches to envision and enact better solutions, and this demand can be met in part through creative teachers enacting innovative literacy pedagogies oriented toward change within and across disciplines.

Transdisciplinary literacy and deep comprehension

Transdisciplinary literacy can be practiced naturally within Project Based Learning. Transdisciplinary literacy taps into multiple disciplinary literacy knowledge spanning more than a single discipline. Student Project Based Learning projects are increasingly in play across content areas including English Language Arts, history and social studies, the sciences and mathematics ([Spires et al., 2016](#)). Based on [Dewey's \(1927\)](#) and [Kilpatrick's \(1918\)](#) early work on the value of student inquiry, and more recent work in Project Based Learning (e.g. [Wurdinger, 2016](#)), [Spires et al. \(2019\)](#) describe a five step process for instituting inquiry projects in various content areas.

In order to truly “own” and comprehend content at a deep level, students can engage in the following 5 steps over the span of a unit: (1) Ask a compelling question; (2) Gather and analyze resources; (3) Creatively synthesize claims and evidence; (4) Critically evaluate and revise findings; and, (5) Share, publish and act on a problem.

For example, in a 10th grade biology class, students used the five inquiry steps to explore local water ecology on a North Carolina river ([Spires et al., 2019](#)) and engaged in disciplinary literacy practices specific to science, English language arts, mathematics, and civics. Students practiced testing pH levels (how acidic the water is with pH values less than 7 indicating acidity) in the school pond as an initial starting point before creating their own compelling question: “How does water pollution affect the ecosystem of the North Carolina Upper Neuse River?” The river is located in the Piedmont area of North Carolina. It provides Raleigh’s major drinking and recreational water source. The river has experienced pollution, resulting in acidity and related algae blooms.

The biology students, organized in teams of four, used online resources to construct annotated bibliographies. They evaluated the credibility of sources that indicated agricultural run-off was responsible for the river’s current pollution. They constructed an Animoto YouTube clip as a public service announcement of their findings and presented this production to other stakeholders including parents and members of the community. The authors note that: “When students address real-world problems that interest them, they are more likely to interact with information inquisitively and curiously, leading to authentic learning incomes” (p. 159). In essence, a well-constructed inquiry project that includes transdisciplinary literacy experiences leads to deep comprehension.

Transdisciplinary literacy practices can be applied to teamwork across disciplines within community college and college reading practices. While silos remain, some promising research suggests that faculty would be willing to embrace more collaboration ([Bean et al., 2018](#)).

Post-secondary disciplinary literacy

In this section we take up the role of post-secondary disciplinary literacy, including community colleges and higher education more generally. In its current form disciplines within higher education often cluster together in their own silos while content area literacy practices advance generic strategies ([Dunkerly-Bean and Bean, 2016](#); [Draper, 2010](#)). For example, recording data in a scientific notebook is typically discipline specific while creating a Venn diagram can be applied to information in multiple content areas. The reality in post-secondary settings is that there is often limited interaction and collaboration between faculty across disciplines, literacy faculty, and literacy professionals.

While researchers ([Gregory and Bean, 2020](#); [Heller, 2010](#)) argue that disciplinary literacy skills are essential in post-secondary and professional settings, “it has yet to catch fire in the content fields of postsecondary education or in developmental reading circles” ([Armstrong and Stahl, 2017](#), p. 114). In order for disciplinary literacy to “catch fire,” the status quo of college disciplinary isolation must change ([Bean et al., 2018](#)). Increasing transdisciplinary collaboration across disciplines, reducing isolated work in silos, participating in collaborative professional development, and curriculum redesign are all steps that can be taken toward changing this status quo ([Bean et al., 2018](#); [Gregory et al., 2019](#); [Gregory and Bean, 2020](#)).

For example, Gregory and Bean (2020) examined disciplinary literacy practices specific to the trades from a sociocultural perspective. In community college mechatronics and diesel mechanics courses, for example, disciplinary literacy was viewed as a social practice influenced by the discipline's discourse (Dunkerly-Bean and Bean, 2016). In order to diagnose and solve problems related to ships, circuits, and instrumentation, students immersed themselves in the robust literacy and disciplinary practices of the field. Through this process, they moved toward becoming members of the discipline, in essence "insiders" in a field of practice (Paulson and Holschuh, 2018). From a sociocultural perspective, as students engaged in disciplinary literacy practices, such as using manuals to repair diesel engines, communicating with clients, or collaboratively repairing broken circuits, they were acquiring critical social capital (Bourdieu, 1986). "Indeed, their ability to flourish in the trades rests on knowing the discourse and procedures for solving problems in the field" (Gregory and Bean, 2020, p. 4).

Faculty across higher education have a great opportunity to provide disciplinary literacy support and instruction for their students. However, they often do not have the background in literacy theory and pedagogy that is greatly needed to best support their students with disciplinary literacy. They may view literacy as basic reading and writing rather than the intricacies of reading discipline-specific texts (e.g. manuals) and writing discipline-specific documents (e.g. lab reports) (Gregory and Bean, 2020). Community college faculty, in particular, have limited time, if any, to learn disciplinary teaching strategies due to high course loads (Gregory and Colclough, 2018).

Both disciplinary and transdisciplinary professional learning communities can provide a space for faculty to explore disciplinary literacy practices and teaching practices (Bean et al., 2018; Bergman, 2014; Furco and Moely, 2012; Jacobs, 2005, 2007). The essential difference is that in disciplinary professional learning communities faculty in this model come from a single discipline (e.g. English) while in a transdisciplinary model, multiple disciplines collaborate to update curriculum and research (Crow and Dabars, 2020).

Jacobs (2005) emphasizes the importance of creating such spaces for faculty to collaborate on neutral ground while sharing leadership and responsibility for increasing student success. In such a space, discipline and literacy faculty can work together to expand their knowledge of disciplinary literacy and how to effectively make a curricular change to better prepare students to be career ready, critically socially minded, and well-versed in disciplinary and transdisciplinary problem solving. Further, transdisciplinary learning communities could provide a space for project-based inquiry and cross-curricular initiatives that would expand students' experience with and knowledge of transdisciplinary literacy.

Critical cosmopolitanism literacy and transdisciplinary literacy

Cosmopolitanism has a long, and dynamic history, most recently applied to education and our increasingly global and interconnected world where students can, via the Internet, communicate and collaborate over vast distances (Bean and Dunkerly-Bean, 2020; Hansen, 2014; Stornaiuolo and Nichols, 2019). In its most recent iteration, critical cosmopolitan literacy (CCL) can be defined as a set of practices to engage students in the critical examination of global and local issues of power, access, and social justice (Bean, 2016). Across multiple disciplines, CCL propels student conversations into a larger sphere where issues of basic human rights, marginalization and oppression can be interrogated.

CCL can drive Project-Based Inquiry to expand beyond nation state borders to address global issues including pandemics, poverty, water and sanitation initiatives, climate change, immigration, public health, and indigenous funds of knowledge (Spires et al., 2019). At the core of this cosmopolitan view is a predisposition that encourages caring toward others from both local and global contexts (Appiah, 2008). As part of their project-based inquiry, students engage in transdisciplinary literacy skills and strategies.

For example, one of the United Nations 17 sustainable development goals is centered on access to clean water for people. An 11th grade English teacher, Ms. Bianchi, engaged her students in argumentative writing centered on expanding their prior knowledge gleaned from natural resource conflict studies in other disciplinary classes including science (Spires et al., 2019). To begin this 6-week unit, Ms. Bianchi and her students read the novel, *A Long Walk to Water* (2010) by Linda Sue Park that features two 11-year-olds, Salva, a boy, and Nya, a girl navigating political conflict in South Sudan as they search for clean water.

Following this initial common reading, students worked in teams with 3–5 students in each team that met 3 times each week in their 60 min block schedule followed by 30 min of teacher led lessons or formative assessments. Each team generated their own compelling questions to start this phase of the unit. For example, one team explored: "How does access to clean water and adequate sanitation impact women's health" (Spires et al., p. 10).

To actually engage her students in intercultural global dialog, Ms. Bianchi brought in experts on global water and sanitation from different countries into her classroom both virtually (via the Internet) and in person to work with the student teams. Thus, the teams had access to a representative from the Organization of Water for Sudan, a civil engineer from the Philippines, and a waterborne disease specialist from Australia, as well as other experts from China. To prepare for their conversations with these experts in the field, students consulted online biographies and published research bibliographies for each expert.

Ultimately, each student team created an annotated bibliography, an argumentative writing piece to weigh warrants and claims about water and sanitation from a global perspective, and a multimodal digital product using Google Docs where they had team space to collaborate. In line with cosmopolitanism and CCL, they had to consider the credibility of various sources of information.

For their final projects they could choose from a variety of multimodal applications including Animoto, Voice Thread, and others. Their audience consisted of community stakeholders, family, and friends. They also had an open access site for posting their work. In addition, they established a Water for South Sudan donation site as part of a worldwide effort to raise money for drilling more wells in South Sudan. This organization was founded by Salva Dut, the main character in *A Long Walk to Water*, bringing this 6-week global unit full circle.

We would be remiss if we did not note why cosmopolitan theory and related activism is important. As we write this chapter the world is in the midst of a global pandemic brought on by the rapidly transmitted Covid-19 Virus that has shuttered businesses, restricted travel, and sequestered students and their families in voluntary and involuntary quarantines. In essence, cosmopolitanism embraces global citizenship and transnational efforts to solve complex problems (Appiah, 2006). For example, access to clean water is a global issue. The [Global Water Project](http://globalwater.org/global-projects) (<http://globalwater.org/global-projects>) centers its efforts on Central and South America, and Africa. This includes hand washing stations for schools, spring catchment systems, hand dug wells, and the involvement of local communities. This is transdisciplinary work around daunting issues that connect all of us beyond nation state borders. All facets of education need to be embracing a future that is global and interconnected and badly in need of creative, critical thinkers.

Despite being the focus of research and policy for over a century, what is meant by the term *adult literacy* remains a bit unclear. In part, this is due to the fact that examinations of adult literacy have been approached from a number of different directions. Formal adult education programs have tended to conceptualize literacy as a set of skills and proficiencies, with the corresponding goal being establishing or enhancing those skills. By contrast, anthropologists and others interested in the role of culture in human development have looked to what adults do with reading and writing to gain insights into different communities and contexts. Finally, there is a well-established tradition of educators and activists making connections between literacy and systemic inequities a central part of their analysis. An examination of each approach will suggest some of the ways that adult literacy has been both understood and misunderstood, and what implications might be for those who are interested in this population of learners.

Adult literacy as a problem

In educational policy and planning discourse, the term *adult literacy* is most often associated with concerns about the reading, writing and numeracy proficiency of adults. Across the globe, municipalities, states and nations fund programs designed to help adults improve their skills, complete compulsory education and/or prepare for employment. Outside of the public sector, there are also volunteer and community-based organizations of various sizes who train tutors and advocate on adult learners' behalf. Because the focus is on the struggle that some adults experience, in this context *adult literacy* functions like a contronym. That is, an interest or commitment to *adult literacy* typically signifies a concern about its potential absence.

The workforce development model

As with many other educational issues, analyses of the state of adults' literacy skills are informed by broader ideological tensions. Within the United States, Canada, the UK and other parts of Europe, support for adult education programs has tended to be framed in economic terms. For example, it is suggested that because employers cannot fill positions due to what has been called a "skills gap," funding adult education programs is a necessary investment in the economy (National Commission on Adult Education, 2008; Goodman et al., 2015). The expectation is that programs will help adults as potential employees develop the skills and dispositions to make them attractive to employers. This is consistent with the logic of human capital development – adults here are understood to be a resource to be cultivated and utilized, and their literacy skills are thus evaluated in terms of economic outcomes. Within this framing, adults with limited literacy skills are blamed for both their own economic vulnerability and their nation's. Indeed, Brine's (2006) review of European Commission policy statements on lifelong learning suggests that, "low knowledge-skilled workers are not only those at risk, they are increasingly constructed as the risk" (p. 649).

In the United States, this commitment to a workforce development model has explicitly shaped federal policy regarding federal support of adult education since the passage of the Workforce Investment Act in 1998 (see Jacobson, 2017, for a summary). This law was updated in 2014 and renamed the Workforce Investment and Opportunity Act, but its core elements remain the same. For example, key outcome metrics for program evaluation still include students gaining employment, retaining employment and/or receiving an increase in wages. In keeping with these goals, adult education providers are expected to help create career pathways for their students and to make the content of their courses responsive to demands of particular local industries (e.g., shipping and logistics, manufacturing, etc.). In what are called Integrated Education and Training (IET) Programs, students combine work on their

literacy and/or English skills with targeted vocational training. This approach is consistent with what has been referred to as *contextualized instruction* - connecting classroom work to adults' lives outside of class, rather than studying subjects in an abstract manner.

As noted above, this neoliberal workforce approach has also been taken up in other countries, often resulting in a shift away from more holistic or humanistic models of adult education. For example, *The Skills for Life* agenda in the United Kingdom has also been criticized for having a narrow focus on employment and for making the ability to access social welfare services dependent upon being "employable" (Hamilton and Pitt, 2011; Allatt and Tett, 2019). Similar criticisms have been made of the *National Skills Foundation Strategy* in Australia (Yasukawa and Osmond, 2019). In Canada, the language of accountability policies is explicit with regards to the goals. Programs are required to report on "training and skills development instead of learning and education" in order to continue receiving funding (Thériault, 2019, p. 19). Here again, it is only in their position as potential employees that adults are deemed worthy of support.

Although the idea of a skills gap is popularly used to explain economic volatility and vulnerability, research suggests that the situation is more complex. Indeed, rather than struggling to find skilled workers for their open positions, some employers report having a hard time finding skilled workers who are willing to accept the wages being offered (Goldstein, 2012; Pellizzari and Fichen, 2013). Here, rhetoric about a pervasive lack of skills is used as cover for a refusal to pay appropriate wages (Gilpin, 2014; Levine, 2013). Many of these same employers also note that they are reluctant to hire workers who have "union-type experience" (Gilpin, 2014, p. 17). Rather than literacy skills being the issue, it is a matter of disposition, as an interest in organizing co-workers makes a potential worker less attractive to the employer. Adult literacy is thus misrepresented and subsequently misunderstood as the problem, moving the analysis away from macroeconomic factors that shape the labor market.

Life skills

Outside of the economic sphere, adult literacy understood in its contronymic form is also associated with other negative outcomes. For example, there is evidence that lower levels of literacy are associated with poorer health (Dewalt et al., 2004). This includes being diagnosed with more advanced stages of prostate cancer (Baquet et al., 1991; Tobias-Machado and Cooperative Brazilian Uro-Oncology Group, 2013), being less likely to access screenings like pap smears and mammograms (Scott et al., 2002) and increased risks of hospitalizations (Baker et al., 2002). In response, adult educators have worked to contextualize literacy instruction within public health efforts (Santos and Paasche-Orlow, 2019), including programs devoted to smoking cessation, diabetes awareness and COVID prevention. These projects are designed to provide adults with the skills necessary to become and stay informed about their own health and the health of those they care about.

Similarly, there is concern about some adults' ability to understand and work with important financial documents. Here again, ideological differences shape the identification of the problem and potential responses to it. For example, Lusardi's (2019) discussion of financial literacy focuses on the ability to do interest rate calculations, understanding inflation and managing risk diversification. This misunderstands or misrepresents the economic conditions most adults find themselves in, as the investment class remains a small fraction of global society. By contrast, the *Financial Literacy and Education Commission in the United States* (2016) pays particular attention to the needs of economically vulnerable populations. The focus of their work is increasing adults' ability to budget, plan for unexpected outcomes and access additional resources when in crisis. For both health and financial literacy efforts, programs vary as to how much they attend to structural versus personal dimensions. Healthy eating may be framed as an individual choice, or an issue of affordable access to healthy foods. Financial literacy may be conceptualized as a matter of surviving with limited means, or developing a strategy to change the economic system that produces that scarcity for exploited populations.

In recent times, there has also been a growing concern about the ability of adults to use computer or digital resources (National Skills Coalition, 2020; Yoon et al., 2020). At times, this has been suggested to mainly be a function of age. For example, nearly two decades after being coined by Prensky (2001), the *Digital Immigrant and Digital Native* dichotomy lives on in popular imagination and policy discourse. Digital Natives – that is to say, younger people – are described as having a natural facility with technology because they were born into a digital world. Digital Immigrants – older adults – were born prior to the advent of the digital age and are thought to be behind the times and struggling to navigate a new reality. In addition to the problematic use of *immigrant* as a metaphor for having a lack of skills or awareness, this assumption perpetuates a deficit model that educators rightly reject in other contexts. Although it is certainly true that some adults find it harder to pick up digital skills, it is not inherent to being older. Many older people learn to use technology on their own terms, and they generally don't need schooling to do so (Selwyn et al., 2006). Indeed, research suggests that in addition to motivation, adults need time and connectivity, and these are not equally distributed. Promoting the idea that age is the key factor distracts from issues with inequitable resource allocation that are endemic to capitalism.

International surveys of adults' literacy skills

Perhaps the clearest indication that adult literacy is considered a problem to be solved is the attention paid to international surveys of adults' skills. For example, the Program for the International Assessment of Adult Competencies (PIAAC) conducted by the Organization for Economic Co-operation and Development (OECD) examines adults' ability to read and understand texts, use mathematics and solve problems (OECD, 2021). Nations are celebrated or critiqued depending upon their place in the rankings and poor results can be part of calls for additional funding for education programs (European Association for the Education of Adults, 2014). Consistent with the human capital approach, Schwerdt et al. (2020) use PIAAC results to investigate how investments in

adult education positively impact Gross Domestic Product. However, the same results can be used to call attention to what social factors might play a role in poor outcomes [Trawick \(2019\)](#). Thus, if adult literacy is understood to be a problem, does it need to be solved for the sake of the economy, or to improve the lives of adults facing precarity?

Adult literacy as a paradigm

The construct of *adolescent literacy* provides a helpful contrast to adult literacy. Central to this concept is the idea that there is something distinct about the reading and writing practices of adolescents. In part, this can be ascribed to the developmental stages they are passing through. Just as important, however, are particular literacy practices that are associated with the young ([Herrera et al., 2016](#)). This includes both formal activities they are expected to engage in (e.g., the genre of school-based essays) and informal activities they do by choice (e.g., chatting while playing online games, reading and writing zines, texting, etc.). By expanding the scope of analysis beyond institutionally valorized practices, researchers have attempted to get a sense of the lifeworld of adolescents and how literacy plays a role in the construction of adolescent identity ([Knobel, 1999](#); [Ito et al., 2019](#)). One goal of this research is to better support adolescent literacy development in formal settings by re-imagining what can be accomplished.

Functional literacy

In comparison, work that has attempted to understand the role that literacy plays in the construction of adult identity is oddly bifurcated. One influential approach is that of *functional literacy*. As with health literacy and financial literacy, the goal here is to move away from decontextualized lessons by focusing on helping adults accomplish literacy-related tasks in their everyday lives. Tests and surveys of functional literacy include various genres of texts adults engage with (e.g., menus, maps, receipts and forms) and include tasks such as locating information, making inferences and connecting text ([White, 2011](#)). Not surprisingly, this is contested terrain. The skills adults need in order to be seen as functioning depend upon how adulthood is conceptualized. Even projects intended to expand beyond simply economic outcomes may work within narrow frameworks. For example, in the 1990's, the Equipped for the Future project in the United States promoted a multi-dimensional vision of functional literacy, identifying literacy skills adults needed in their roles as workers, family members, community members and as learners. Although broader than a purely economic model, this framework still centered adult literacy practices around what are seen as productive roles or what the adult is expected to contribute. There was an implicit prioritization of what adults' responsibilities were to their family, their community and their employer. The focus was squarely on what adults *need* to do with literacy, not what they might *want* to do with it.

In sharp contrast, adult literacy as conceptualized by researchers working outside of the field of formal literacy pedagogy is much broader and more sensitive to the diverse ways that adults use texts. Indeed, the social practice turn in literacy studies was founded in large part upon studies of adults' literacy practices. [Scribner and Cole's \(1981\)](#) work with the Vai, [Street's \(1984\)](#) work in Iran and [Heath's \(1983\)](#) work with families in United States all study the ways that adults use literacy in their daily lives, and how those practices are shaped by a variety of sociocultural and socioeconomic factors. In [Barton and Hamilton's \(1998\)](#) survey of the literacy practices of adults in Lancaster, in addition to "getting things done in the community" (e.g., organizing meetings, creating newsletters, making flyers for yard sales), reading and writing were taken up as part of "leisure and pleasure" (e.g., getting lost in a book, writing stories, being a fan or collector). This research helps emphasize the fact that adults engaging in literacy practices are not completely defined by their roles as workers and economic beings. Moreover, as with adolescents, adults' literacy practices are also a part of expressions of identity.

Adult literacy and identity formation

For example, there is a rich body of literature that examines the nature of African American women's literacy practices. Researchers have explored how shared social rules and expectations about reading and writing shape relationships between African American women (and relationships between African American women and others) (e.g., [Lanehart, 2002](#); [Baugh and Smitherman, 2007](#)). Because these cultural practices are diverse, there is not a single "African American women's literacy practice." However, [Richardson \(2003\)](#) helpfully suggests that the concept of African American female literacies "refers to the ways of knowing and acting and the development of skills, vernacular expressive arts and crafts that help females to advance and protect themselves and their loved ones in society" (p. 77). Although not reducible to linguistic structures, studies have looked at how African American women's literacies are informed by their use of African American Vernacular English ([Redd and Webb, 2005](#)), particular rhetorical structures ([Ball, 1992](#); [Lee, 2007](#)), and the strategic use of silence ([Franklin and Dowdy, 2005](#), citing the work of [Rybarczyk and Bellig, 1997](#)). Indeed, what is left unsaid can function as a powerful critique of racial capitalism, patriarchy and the privileging of so-called "mainstream" American English. Silence should not be mistaken for the inability to speak. A key implication of this is that what is left unwritten needs to be included in considerations of literacy practices.

The role that literacy plays in immigrant communities also highlights how adults often adapt to new circumstances. For example, [Kalmar \(2001\)](#) detailed the experiences of a group of Spanish speaking migrant workers who created their own English orthography in the absence of formal English classes. In Nara, Japan, I met with Nepali immigrants who had done the same by using the Napali alphabet to represent the sounds of Japanese. In both cases, immigrant adults were creatively refashioning existing linguistic and textual resources. Studies during the early days of the expansion of the internet identified the ways that immigrant communities

utilized online portals and sites to stay connected their countries of origins (Lam, 2006; Yao, 2009). Here, actual immigrant adults are displaying the type of facility with digital resources that is supposed to be difficult for metaphorical digital immigrants, further highlighting the problematic nature of the trope.

Adult literacy practices also provide insight into the ways that literacy can be central in the creation of new communities based on other common interests, such as hobbies and fandom. For example, although writing and distributing zines is often associated with younger readers and writers, some of the earliest pioneers included women writing *Star Trek* fan fiction in the early 1970s (Bacon-Smith, 1992). The members of this community found each other through distributing the stories they were writing and bonded over their shared love of the show. Current research into zine production has examined how men are exploring new ways to express their gender and racial identities (Guzzetti, 2019) and there is a flowering of zines made by and for the transgender community (e.g., *Trans Affirming Magical Care* – a zine made by transgender Harry Potter fans in response to J.K. Rowling's public statements about transgender politics). Over the decades, zine creators have adapted their methods, moving from mimeograph machines, to copiers and now to the internet. Again, rather than being behind technological change, some communities of adults have modeled how to take full advantage of new affordances.

Non-valorized practices

The non-valorized nature of these practices is consistent with the vulnerability of certain adult populations. Kalman (1999) documented the work of scribes who set up temporary shop on the edges of public plazas in Mexico to earn a living reading and writing letters for those who cannot. Here, literacy skills provide for informal employment and way to manage a difficult situation. Even more precarious are those adults who write messages on paper or cardboard as a means of asking for assistance from passersby. These signs are vulnerable to both the elements and the authorities. For example, police in Alabama (in the United States) made a “quilt” of the signs they had taken from unsheltered people (Burke, 2019). This action demonstrates both a clear lack of empathy on the part of law enforcement and the stigmatized nature of this literacy practice. Their literacy skills may be one of the few resources these adults have, but their written calls for help often become an object of scorn.

By contrast, non-valorized literacy practices of adults who are not in such precarious positions face fewer sanctions. For example, it is a common practice in meetings for adults to surf the web or to send emails and texts that are not work-related. While doing so, these workers may engage in mock participation, and such dissimulations are accepted to be part of white collar working life. In fact, this type of activity is part of a long tradition of workers reclaiming bits of time or resources away from the employer. de Certeau (1984) identifies it as “la perruque,” and notes that while formally discouraged, it is informally expected to take place. Another example of a non-valorized literacy practice that produces fewer sanctions is posting hostile comments on discussion boards. For example, in a study of interactions on sports news message boards, Jacobson (2019) noted the prevalence of racist, misogynistic and homophobic discourse. Although some comments did receive pushback, any stigma or scorn toxic posters faced did not rise to the level of signs being taken from the unsheltered.

An expansive view of adult literacy points to how the literacy practices of adults can be used to amplify voices or silence them, create or disturb community, and recognize or dehumanize each other. In this way, adult literacy serves as a paradigm for the social model of literacy, as literacy can only be understood within complex and dynamic sociocultural and socioeconomic contexts. Being an adult is complicated, and adult literacy practices are no less so. Although adopting this perspective expands our sense of what formal programs can take up (Jacobson et al., 2003), just as importantly it highlights the multiple ways that adults continue to develop their literacy skills and practices in a variety of informal and non-formal contexts (Brandt, 2001; Purcell-Gates, 1995). People, regardless of age, want to be engaged in play, study, activity and work that is relevant and meaningful.

Adult literacy as political praxis

Although there is ample evidence of the negative impact neoliberalism has had on the provision of adult education (and education more generally), it should not be understood as a historical anomaly. For example, in Graff's (1991) analysis of seismic educational shifts in the 1800s, the introduction of mass schooling in Canada and other places was a reaction on the part of the ruling class to the fact that the working class was becoming literate on its own terms. Rather than being some kind of benevolent gesture or measure of social progress, the expansion of formal education can be read as an attempt to direct and control the nature of the working class' literacy activities. The curriculum of the time included frequent invocations of religious themes and a call for people to accept their place in the established social hierarchy. As with the legal prohibition against teaching enslaved people how to read and write in the United States, this domestication of working class literacy was a means to maintain the status quo.

Adult literacy and political struggle

Not surprisingly, states undergoing revolutionary changes have understood increases in adult literacy skills as a key part of their struggle. National literacy campaigns in the Soviet Union (Clark, 1995), Cuba (Herman, 2012) and Viet Nam (Anderson, 1995) explicitly connected literacy education to political action. Smaller groups working toward social justice have also engaged in these types of coordinated efforts. For example, in the United States, enslaved African American risked their lives to teach themselves and others how to read. Nearly a century later, literacy programs were an important part of the civil rights movement (e.g., the

Citizenship Schools founded by Esau Jenkins and Septima Clark in South Carolina). Similar efforts were undertaken in Japan, where adult literacy was an important part of the struggles of both the Buraku and Korean communities against discrimination (Asano, 1990; Mori, 1995). Freire (1985) documents similar projects in Brazil and Guinea Bissau. In each case, adult literacy instruction relied upon a commitment to praxis – the cycle of taking informed action on the world, critically reflecting on the results and developing theory that informs subsequent actions. This approach to literacy shifts focus away from isolated evaluations of skills (e.g., decoding, encoding) or accounts of diversity in cultural practices (e.g., how particular religious communities organize around sacred texts) and toward the impact adults' myriad literacy practices have on their community and the world.

In contrast to atomized accounts of literacy skills, adult literacy understood as praxis is necessarily realized in collective activity (Osawa, 1990). An influential demonstration of this is the work of the Combahee River Collective (Taylor, 2017), who were a non-formal study group active in Boston in the 1970 dedicated to developing a Marxism fully informed by the experiences of African American women. Per Barton and Hamilton (1998), they were using literacy to “get things done in the community,” but in this case, their goal was communal liberation from the interlaced oppressions they faced (e.g., racism, sexism, capitalism). As with other self-directed learning projects (Tough, 2002), the group itself selected the texts for study and generated the questions that guided their analysis. One result of their work was a publicly shared statement that articulated the concepts of identity politics and intersectionality before they became more widely known. The Collective's activities made clear the ideological dimensions of what were described above as African American women's literacy practices – the common concern for protecting their loved ones and shared understandings of the world informed a distinctive vision of change. In current times, adult education projects in Mexico and Central America dedicated to local and regional decolonization efforts demonstrate similar approaches. Rather than embracing decontextualized concepts of literacy or imported discourses of liberation, activists there are drawing on and articulating indigenous epistemologies to make their own way forward (Meyer and Alvarado, 2010). Similar efforts are underway in South America, where groups of workers who share a commitment to horizontalism are experimenting with new forms of non-hierarchical adult education (Sitrin, 2012).

Problematizing technology

The near ubiquity of the internet and social media has created new affordances for adults to take action on the world via literacy. For example, Jung's (2019) studied how a Korean American women's community used an online forum to take action around sexual harassment and assault. A key was their strategic use of posts, petitions and social media hashtags to get their message across. As another example, Palestinian hacktivists (Skare, 2016) have moved their resistance to Israeli occupation online by attacking government and corporate websites. Though they differ in scale and technical complexity, what these efforts share is an origin in informal groups and self-study. Learning how to take political action in cyberspace is not taught in schools. Because digital spaces can create barriers to participation, particularly for those with certain impairments, just getting online can be a profoundly political act. Ellcessor (2016) provides an account of disability activists simultaneously adapting available resources and arguing for wider accessibility as an equity issue. In each of these cases, what has been referred to as digital literacy involves the use of digital resources for fully engaged praxis, rather than the passive consumption of information.

The ubiquity of technology has also been identified as a key feature of an expanded surveillance state, and it creates a need for shifts in praxis. For example, Eubanks (2012) has reported on efforts of women in an adult literacy class to examine how they are being tracked and monitored by the social welfare system in the United States when they use electronic cards to access resources. This became the first step in them developing a “critical technological citizenship” that drew on their own experiences with technology in order to advocate for fair housing, welfare and education policies. Similarly, adult learners who contributed to a technology themed issue of *The Change Agent* (a newspaper dedicated to writings by adult learners focused on social justice issues), balanced praise for devices like cell phones and tablets with concerns about the environmental and personal costs. For example, dos Santos (2013) explained to other adult learners how cookies work as part of Google searches and why users get targeted advertising. dos Santos explains in clear terms, “In a way, you are the product. You— your history, your habits, your interests, etc.— are being sold to companies that want to sell you things” (p. 44). Rather than coming from a formal study of technology, this critique is a result of the same type of popular education programs that Eubanks described.

The concern with how technology aids surveillance extends beyond the internet, as researchers and activists have been tracking how we are being read by public places that we pass through, via security cameras, facial recognition software, GPS on cell phones and other means. McCullough (2013) suggests that, “Citizens have a right to engage one another and the built world they inhabit in ways that are unmediated, uninstructed, unscripted and undocumented” (p. 273). To preserve that right, Brunton and Nissenbaum (2016) describe what they refer to as the strategy of obfuscation, “the deliberate addition of ambiguous, confusing, or misleading information to interfere with surveillance and data collection” (p. 1). More directly, those working in activist communities are careful to use communication platforms that are less liable to be hacked and monitored, and teach each other how to stay as safe as possible. For this reason, so-called digital literacy is not just about getting online and getting connected, it includes being able to manage when and where you want to be connected and monitored.

An addition to expanded means of surveillance, there is a concern that the way the internet and social media have developed has made it more difficult to determine the veracity of what we read, see and hear. Digital literacy is thus linked to information literacy, with the goal of helping users distinguish facts from incorrect reports, propaganda or outright lies. This is true not only of those who are labeled adult literacy learners, but those with college educations and advanced degrees. It is also not a new issue. Purcell-Gates (2007) suggested that in the run up to the second Gulf war, the behavior of many politicians and thought leaders in the United

States suggested a lack of the kind of skills that adults in literacy programs are asked to work on improving (e.g., reading critically, connecting texts, etc.). Although it is true that it can be difficult to navigate a complex mediascape, the poor information literacy of the credentialed class can also be understood to be a form of a gnosis (Moffett, 1988) - an unwillingness to comprehend or to consider ideas that challenge one's own views.

Conclusion

There is ample evidence that adults who have no issues with decoding take on a stance of willful ignorance and refuse to engage with texts that threaten their understanding of the world. In Moffett's case, parents and others in the US in the 1970's were enraged that their children were being given textbooks that had critiques of the United States in them (e.g., reporting on US war crimes abroad and systemic racist violence at home). These fights over the content of textbooks are once again on the rise in the United States, with some parents sharing the same desire to remove mention of anything that runs counter to ideas of American exceptionalism. This is happening at the same time significant numbers of adults deny the reality of the climate crisis that is already upon us and the existence of the COVID pandemic. However, when the PIAAC and other national surveys are used to identify potential problems with adult literacy that create risk for individuals and society, this deep-seated and ideologically motivated desire not to know is not part of the evaluation. Given the seriousness of the multiple crises the global community faces, rather than learners in adult literacy programs, it is those with degrees, credentials and valorized literacy skills that are *the* risk, and they are putting the rest of the world *at* risk.

When conceived of as a problem with skills or as paradigmatic of social models of literacy, *adult literacy* functions as an odd type of marked case. Indeed, the majority of literacy activity carried out across the world is conducted by adults, and at any given time, adults are engaged in a nearly countless number of activities. This includes writing poetry, plays and novels, presenting proposals for research or business, reporting on the news and drafting laws and policies. These activities typically do not factor in discussions of adults' reading and writing.

Instead, the focus is on what are thought of as commonplace practices, such as the writing of shopping lists, correspondence or reading the labels of medicine bottles. This narrow view of adult literacy means that the term is only applied to certain populations, typically those who need to work on their skills or those who are looking to make it through another day. If attention to adult literacy continues to be misunderstood as a means of propping up the current economic system, we are likely to perpetuate existing inequalities. However, if we understand adult literacy as the praxis of all adults, and not just those in programs, we might be able to make the profound changes we need to survive as a species.

The term “college reading,” as used in this entry, is being applied on two parallel levels. It is first meant to describe a professional field of researchers, theoreticians, and practitioners whose work focuses on, generally, learning with and through text at the postsecondary education level. In a second sense, college reading is a broad descriptor for a range of constructs focused on the academic literacy expectations and demands required for a learner’s successful journey through stages of postsecondary/tertiary experience. The culture of reading at a particular institution of higher education, whether a liberal arts college, a community college, a technical college, or an elite university, will determine whether or not reading is taught, and, if so, how: explicitly within disciplinary offerings, through pre-credit remedial or developmental courses, or as non-course-based options in learning assistance centers or tutorial programs. On the other hand, considerations for college reading also determine whether a learner’s competencies in reading are expected to grow in both breadth and depth from the learner’s immersion in a rich academic content and under the guidance of a highly knowledgeable faculty.

In the nascent 21st century, the term “college reading” (CR) requires purposeful framing, as it can simultaneously be used to represent the pervasive culture of literacies throughout an institution as well as specific curricular offerings charged with explicitly training students to be effective and efficient learners. Over time, CR has been used to describe instruction that is remedial and also instruction that is developmental in the sense that every student, regardless of level or status within the institution, benefits. And, CR has and continues to refer to both a narrow, skills-based focus on reading competency as well as a broader focus on higher-order, strategic learning processes.

Our discussion of college reading must begin with an acknowledgment of the differences in tertiary and postsecondary education across international contexts. Because other nations either exclude any reading instruction in higher education or include elements of reading embedded in informal educational contexts such as adult and community literacy, and not necessarily in a model of developmental education in formal postsecondary contexts (as in the US), much of the historical discussion that follows is US-centric.

History

The study of reading in postsecondary institutions of the US begins with the founding of Harvard College in 1636 (Stahl and King, 2018; Wyatt, 1992). Then, continuing for more than two centuries, subject matter in colleges across the country concentrated intensely upon a limited number of fields such as philosophy, theology, and classical studies. Books had great monetary value and though not widely distributed were found in libraries for use by faculty and senior-level students. Students might also belong to literary societies that maintained libraries of academic books, though often of a more secular nature. Admission to college was seen as proof that students could read (Leedy, 1958).

When land grant colleges and the state colleges/universities began appearing beyond the eastern shores, these institutions regularly found that incoming students lacked sufficient competency in the basic skills. This awareness led to schools such as the University of Wisconsin establishing preparatory departments (preparatory programs at essentially high school levels), where admitted students would be prepared to handle the rigors of the college-level courses offered in the institutions (Arendale, 2010).

Subsequently, the emergence of US universities modeled after institutions such as Germany's universities, including Johns Hopkins in the latter 1800s, shifted the mission of higher education to a focus on research, physical and life science, social science, and English literature. In these newer institutions, libraries became more active in their agency for scholarship. With a greater breadth in the curriculum, the role of reading and literacy competence levels required to read across multiple fields now took on new meaning and importance. The rigid and narrow curriculum of the past, with reliance on recitation, eventually gave way to survey courses, lectures, extensive reading with new texts, collateral reading, and class tests.

Several formative research studies, curricular innovations, and textbook publications across the latter 1890s and first decades of the 20th century gave rise to the nascent field of college reading:

- Abell's (1894) first research study with college readers,
- Hinsdale's (1900) *The Art of Study*,
- McMurry's (1909) *How to Study and Teaching How to Study*,
- Koopman's (1913) qualitatively oriented study of students' reading behaviors,
- Moore's (1915) implementation of a "how to study" course at Harvard, and
- Kerfoot's (1916) authorship of *How to Read: Techniques of Reading Improvement*.

Furthermore, studies by early psychologists on reading habits, skimming, speed, comprehension, work study skills, and eye movement research, as well as the appearance of standardized tests led to an understanding that not all college students were reading-ready for college demands, at least as measured by the new learning science embodied in these new tests. Indeed, Leedy (1958) has productively designated the period from 1910 to 1920 as the *formative years* for the field. Courses had a heavy emphasis on how to study with collateral work in reading.

By the latter 1920s, interest in the "reading problem" with 1st-year college students had reached a new level. A new student clientele was coming to college. Orientation courses (Strang, 1937; Traxler, 1938) that often included some coverage of work study skills emerged. Book (1927a,b) determined that students experiencing academic difficulties at the University of Indiana were deficient in reading study skills and that they would benefit from taking a "how to study" course. Parr (1930) conducted the first national survey of reading and study courses, and while the sample was limited (as was response), information became available on the operation of programs across the nation. In the same year Eurich (1929) and Haggerty and Eurich (1929) released the *Minnesota Speed of Reading Test* and a *Test of Reading Comprehension* for the college population. What was likely the first summer bridge program focusing on work study skills was delivered at the University of Buffalo.

With the 1930s students were expected to read effectively and efficiently with an ever-increasing volume of texts. Assessment of students' reading abilities was now often undertaken at their time of admission. The nation's center for research and praxis was The Ohio State University (OSU) where, under the leadership of Luella Cole Pressey and Sidney Pressey, one of the first contextualized study courses was offered (see Stahl and Armstrong, 2020). As programs sprung up throughout the country so did early use of technology designed to measure and/or promote students' efficient eye movements in reading (e.g., the Harvard and the Iowa reading films, the metronoscope, the ophthalmograph, and the tachistoscope). It became a period during which the field of college reading received a certain degree of acceptance and even stature, in part, because of the growth in research and the knowledge that not all students were predicted to be able to handle the reading load (Leedy, 1958).

The second world war had direct influence upon college reading instruction, demonstrated by the STAR Program at OSU. Robinson (1943) found that all students, even the best and brightest, could benefit from study skills instruction. During that same decade, two early attempts integrated reading and learning techniques in content courses that took place in the field (City College of New York in educational psychology, and College of St. Scholastica in English). College reading pioneer James M. McCallister (1942) authored *Purposeful Reading in College* (1942), a model for the texts to come in the 1980s. The first part of each of McCallister's chapters presented instruction on reading and study skills, while in the second section students would undertake comprehension tasks and rate improvement with paragraphs from contemporary college content area texts. Frances Oralind Triggs (1943) released *Remedial Reading: The Diagnosis and Correction of Reading Difficulties at the College Level*, which was the first book to train reading/learning specialists for the postsecondary field. In 1946, Robinson released *Effective Study*, with its focus on research-driven, higher-level study skills such as SurveyQ3R. As such, *Effective Study* became the model for books across the next three decades. The close of the 1940s decade hosted debates on speed versus comprehension, mechanized reading instruction versus more natural approaches, and controlled versus uncontrolled instruction.

The design of programming for the 1950s was greatly defined by the Servicemen's Readjustment Act of 1944 (i.e., the GI Bill of Rights), as thousands of veterans entered or reentered postsecondary institutions. Reading load expectations for college students were greater than anytime previous in the history of higher education. Yet, colleges were becoming increasingly aware that numerous students were not prepared to handle the rigors of such reading and learning requirements. Surveys from the previous decade and those conducted during the 1950s demonstrated that support programs differed greatly in mission, institutional support, and in their designs. Faculty charged with the teaching of reading and study skills from across the west convened to promote research and discuss praxis leading to the founding of the Southwest Reading Conference (now the Literacy Research Association) in 1952. Later on, and with similar rationale, the College Reading Association (now the Association for Literacy Educators

and Researchers) was formed in 1958. Federal legislation (National Defense Act of 1958) further expanded the population of college-going individuals. At Harvard University, William Perry found that entering students could not write a short sentence about the content of a chapter from a college-level textbook, nor could many students identify a well-written essay response. Perry's (1959) subsequent report to the Harvard faculty was used by programs across the nation as a rationale for widely implementing developmental reading programs. Finally, in 1958, Leedy authored the foundational work *A History of the Origin and Development of Instruction in Reading Improvement at the College Level*.

In the 1960s, a time of cultural deconstruction of hierarchy, numerous colleges adopted open-admissions programs. Congress passed legislation titled the Higher Education Act of 1965 with grants for undergraduates. From the earlier decade, the pervasive influence of the *Evelyn Wood Reading Dynamics* (Maxwell, 1979; Wood, 1960) in the popular culture created an emphasis on speed reading within college reading programs, also making use of the EDL Controlled Reader, the Craig Reader, the Perceptoscope, the Tachomatic 500, and the Hoffman Readers (see Berger and Peebles, 1976). Furthermore, the learning theories of behaviorism, exemplified in Skinner's (1957) *Verbal Behavior*, led to increased use of programmed reading skill builders in CR. In fact, Lowe (1968) discovered that on some campuses there could be multiple programs offering college reading and study skills training.

In the 1970s the fruition of student success programming arrived with the birth of the learning skills centers across the country. Many of the leaders of this movement possessed a qualifying academic background in the reading/learning field. While Martha Maxwell (1966) disseminated a plan for a campus-wide program, Frank Christ (1971) received the credit for the first learning assistance center in the nation at Long Beach State University. Programs were resourced by institutions providing traditional college reading programs and counseling centers that provided students with diagnostic assessment, computer-assisted instruction, tutoring, and mini-courses associated with reading and study skills development.

With the full impact of the cognitive revolution in the 1980s and on into the 1990s, postsecondary researchers in the fields of education, cognitive psychology, linguistics, and university developmental education programs began to focus on interactive, contextual, and generative theories as related to students' mastery of strategic reading and learning processes, in preference to the simple description or effectiveness of a reading and/or study skills course. Impactful research and related training programs were centered at the University of Georgia and Georgia State University. Textbooks such as McWhorter (1980) and Nist and Diehl (1985) employed simulation models that embedded reading and learning strategies, contextualizing instruction in stand-alone, precredit reading courses, with somewhat standardized developmental education programs. Bartholomae and Petrosky (1986) released a groundbreaking text for reading/writing-centered approaches that described the theory and praxis associated with the Basic Reading/Basic Writing course from the University of Pittsburgh, which continues to impact the delivery of current integrated reading and writing (IRW) classes (Armstrong et al., 2018).

Martha Maxwell encapsulated the status and positioning of the field at the beginning of the new millennium in the first edition of *The Handbook of College Reading and Study Strategy Research* (Maxwell, 2000). She described the continuing debate on reading and learning strategies required for success in college, as well as where and how the relevant instruction should be delivered. Indeed, more widely, there was also disagreement on the very definition and the theoretical foundations of reading, particularly whether reading was a process, a product, or a discipline, or a mix of all three? After experiencing a decade when numerous programs were removed from 4-year institutions, Maxwell questioned whether CR coursework had actually been successful. She was one of the first professionals to point out that mandated gatekeeping courses associated with the developmental education practices of pseudo-diagnosis (testing), placement, and remediation led to stigmatizing students, increasing drop-out rates, lowering of self-confidence, and delaying progress toward the degree objective. She further highlighted that under-trained or mis-trained instructors continued to plague the CR field. On the more positive side and with prescience regarding the coming of disciplinary literacies, Maxwell pointed out that all students, not just those placed into developmental education, required assistance in mastering the texts used in content fields, where text expectations frequently exceed learners' functional competence. Finally, it was proposed that more viable alternatives to traditional courses might include adjunct and paired classes, supplemental instruction, tutoring services, and emerging technological supports that might promote student learning competencies that had emerged across the previous two decades.

Curricular structures, past and present

Depending on definitions for CR, as well as the overall theoretical and pedagogical model adopted, a number of curricular approaches may be relevant. Historically, in the US, CR has often been enacted within traditional remedial and developmental education courses. Many course models have existed over the years, including stand-alone reading courses, strings of stacked prerequisite courses, reading courses paired with content area courses, integrated reading and writing courses, among others. In the past, such courses were intimately connected with developmental education and academic assistance across higher education. However, over the past four decades, state-level mandates in the US have all but removed such interventions—including centralized developmental education units—at 4-year universities, deferring such courses to community colleges (e.g., Ohio Revised Code, 2017; Tennessee SB 7006, 2010).

In line with these moves to relegate reading instruction to 2-year institutions, much criticism has been aimed at stacked, stand-alone reading and learning courses at the postsecondary level in the US (Bailey et al., 2010; Edgecombe et al., 2013; Rutschow et al., 2019). Therefore, as part of a much larger reform of community college education, significant curricular and structural changes for CR are underway. Most significantly, individual reading and learning courses are being minimized or even eradicated, yielding to

preferences for curricular structures that integrate or blend reading with other content. Specifically, integrated reading and writing (IRW), a course model originally designed at the University of Pittsburgh (Bartholomae and Petrosky, 1986), has been revisited as a way to accelerate students through developmental education courses. Similarly, contextualized reading and learning within content courses or career technical education courses is a popular reform, with wide-scale models such as the State of Washington's I-BEST leading the way (Jenkins et al., 2009; Wachen et al., 2011; Zeidenberg et al., 2010). Another new structure is corequisite courses (Daugherty et al., 2018) that embed a support training (often an IRW course) within a college-level course, such as required 1st-year composition.

Historically, much of the work of CR in the US has tended to be course-based. However, other non-course-based curricular structures have also been utilized. These have included reading labs, workshops hosted by learning assistance centers, and students' individual work with reading specialists in tutoring centers. Other such specialized programs that include some aspect of reading and learning instruction include bridge programs, college transition courses, and adjunct courses (Johnson and Carpenter, 2000).

Beyond the US, course-based interventions for reading are less prevalent in tertiary educational settings as these types of interventions often exist only in situations where students have not passed admissions exams. For instance, in Sahito et al. (2017) investigation of students in a university in Pakistan, a newly created remedial English course was explored from the perspective of both students and teachers.

Instructional foci

Regardless of the particular curricular structure, much reading and learning instruction at the postsecondary level tends to focus on issues related to reading comprehension. Although the theoretical model applied will undoubtedly shape instructional focus, specific instructional foci are related to the course type. The traditional remedial reading course foci tend to emphasize more discrete skills, such as identification of a text's main idea and supporting details, vocabulary development, procedural aspects of reading strategies, and use of context clues based on the belief that there was a necessary "developmental" ladder of skills for reading competence (Stahl and Armstrong, 2018). More prevalent, however, are developmental and transitional reading approaches that tend to focus on strategic reading with an emphasis on the cognitive, metacognitive, and affective correlates that impact reading comprehension (Holschuh and Lampi, 2018; Holschuh and Paulson, 2013; Simpson and Nist, 2002). Specific instructional foci in these courses include strategic vocabulary building, context-dependent reading and learning strategies, metacognitive strategies, flexibility and self-regulation, and an emphasis on reading across contexts (disciplinary literacy). With the developmental education model found in most community colleges, identified students were not allowed to register in general education courses before successfully completing any requirements association. Hence, courses were generally taught via a simulation model that lacked direct contextualization and had questionable transfer value to courses in which the students would enroll in future terms (Stahl et al., 2020). In the second decade of the 21st century this model has been found to be on the decline. Because the majority of published literature on CR tends to be practical in its focus, a wealth of explanation exists on both general and specific instructional practice (e.g., Armstrong and Newman, 2011; Nist and Simpson, 2000; Simpson et al., 2004).

Assessment

Generally speaking, to reference assessment as it relates to college reading and learning means to reference placement testing, or an initial screening of a student's readiness for college-level reading (Flippo et al., 2018). Historically, such placement tests have helped determine whether a student places directly into college-level courses or is instead first referred to a developmental reading course. As one of the key contributors to the present critique of stand-alone developmental reading courses, single, cognitively oriented placement tests that determine students' placement into or out of developmental reading have largely become the focus of conversations related to assessment. For many years, scholars of college reading and learning have called for multiple placement measures that incorporate a mix of cognitive and affective instruments (e.g., Bliss, 2001; Maxwell, 1997; Roueche and Kirk, 1973). These proposed revisions also include more holistic assessment of learners' reading experiences or preparedness (i.e., secondary school overall GPA, and grades in target courses), calls that have been largely ignored until the most recent era, much to the detriment of the field of CR.

A less-common type of assessment used within college reading is a more fine-grained diagnosis. Diagnostic assessment in reading at the college level typically occurs within disability resource centers, tutoring centers, or reading labs, and tends to be disconnected from the student's coursework (Flippo et al., 2018). A less-common type of assessment is program evaluation, which can provide information on student progress. Such data can inform instructional changes or provide information on the overall success of a program (Armstrong and Williams, 2019; Simpson, 2002).

Professional associations

Although there are a number of professional associations that focus on the larger field of literacy, such is not currently the case for postsecondary reading and learning instruction. Yet, that has not always been so. In 1953, the Southwest Reading Conference for Colleges and Universities (SWRC) was organized, and later, in 1958, the College Reading Association (CRA) was established. Both

groups had a designated focus on CR. Then in 1966, the Western College Reading Association (WCRA) was founded. After decades, the SWRC eventually became the Literacy Research Association (<https://literacyresearchassociation.org>); CRA became the Association of Literacy Educators and Researchers (<https://www.aleronline.org/default.aspx>); and WCRA became the College Reading and Learning Association (<https://www.crla.net>). Although each association has greatly expanded its respective mission and audience, postsecondary literacy is still a welcome topic for conference presentations and for journal articles. The one rather small organization that specifically focuses on college reading and learning was found within the International Literacy Association as a special interest group known as College Literacy and Learning. Unfortunately, professional literacy associations tend toward PK-12 orientations with the effect of marginalizing the field of college reading and learning within the greater literacy field.

Beyond literacy-oriented associations, college reading and learning professionals regularly participate in associations including the Association of Colleges for Tutoring and Learning Assistance (<http://actla.info/contact-us/>), the Association for the Coaching & Tutoring Profession (<https://www.myactp.com>), the National College Learning Center Association (<https://nclca.wildapricot.org>), and the National Organization for Student Success (<https://thenoss.org>).

Beyond the US, college reading and learning specialists may belong to the Federation of European Literacy Associations (<https://www.literacyeurope.org>), or to the member associations of the International Consortium of Academic Language and Learning Developers (<https://icalld.wordpress.com>), the Association for Academic Language and Learning (Australia) (<https://www.aall.org.au>), the Learning Specialists Association of Canada (<http://lsac.wildapricot.org>), the Association for Learning Development in Higher Education (United Kingdom) (<https://aldinhe.ac.uk>), the Association of Tertiary Learning Advisors of Aotearoa (New Zealand) (<http://atlaanz.org>), and the Scottish Higher Education Learning Developers (<https://www.scotelas.org/about-us>), among others.

Theoretical assumptions

As with reading and literacy learning at any stage or in any context, there are many theories that intersect within reading and literacy at the college level. However, a thorough review of foundational texts pertaining to theories and models of reading fails to identify a model specific to the college context. There are, of course, models that touch upon or partially address the college context. For one, Holmes' (1948) substrata factor theory initially grew out of his dissertation with college students but evolved into a more generalized model across time. Also, Chall's (1983) stages of reading development model included a stage 5: construction and reconstruction that focused on college and adult readers (also see Heron, 1989) although it was more directly oriented to the earlier stages of reading mastery. At this point, although many models may have implications for reading at the college level, none identified takes into account the particulars of the college context, culture, forms of language, or student or faculty philosophies of learning. Such a model is needed to serve as a touchstone for researchers to evaluate research or for practitioners to evaluate praxis. Hence, a proposal for an evolving model for college reading follows.

First and foremost, any theoretical model of college reading must proceed from an understanding of the wide range of learner backgrounds within literacy instruction at the postsecondary level. Second, this understanding of learner diversity cannot be divorced from a deep awareness of the demands of the educational context. More specifically, an understanding of the potential difficulties caused by a mismatch of primary and secondary Discourses (Gee, 2001) are important aspects of learning and literacy theory in this context. These theories must necessarily include a focus on the restrictions and limitations of system-bound languages, and not fetishize assumed learner deficits. And, third, any theoretical perspective that positions reading as merely and exclusively a set of decontextualized skills should be understood as ultimately being theoretically unsupported and pedagogically ineffective. Rather, reading at the college level is reading to learn and reading to do, both in the immediate learning context and for the future.

En route to a future, more complete model, we propose eight complementary and often overlapping theoretical accounts that may provide the framing for explaining, evaluating, and researching reading in the college context, and might also further determine the field of college reading. These eight accounts are as follows:

- Lifespan Literacy (e.g., Alexander, 2006; Kerfoot, 1916)
- Funds of Knowledge (González et al., 2006)
- Academic, Disciplinary, and Professional Literacies (Shanahan and Shanahan, 2008)
- Vernacular Literacies (Ivanic et al., 2009)
- New Literacies—Multimodal Pedagogy (Jewitt, 2014; Knobel and Lankshear, 2007; Street, 1995)
- Contextualization (Perin, 2011)
- Entextualization (Baumann and Briggs, 1990; Leppänen et al., 2013)
- Positioning Theory (Harré and van Langenhove, 1999; McVee et al., 2019)

We acknowledge that these theoretical constructs often share concepts and content used in building theories. For the sake of clarity, these constructs can be placed into three general categories: those that focus on learner attributes (Lifespan Literacy and Funds of Knowledge), those that focus on the language and text practices valued and privileged in college contexts (Academic, Disciplinary, and Professional Literacies; Vernaculars; and New Literacies), and those that focus on the specific expectations and purposes of the college context (Contextualization, Entextualization, and Positioning Theory).

Perspectives focused on learner attributes

Lifespan literacy

We are all, always, learning to read. Alexander's (2006) position is that we develop as readers and learners across our lifetimes (see also Kerfoot, 1916). Consequently, learners benefit from focused and explicit literacy support across their lives, not just in the primary grades, as so often assumed. Beginning postsecondary students are faced with a number of developmental and personal transitions (relational, social, cultural, and academic), not the least significant of which is a literacy transition to the academic literacy practices and expectations of higher education and ultimately to a particular discipline. A lifespan literacy perspective is therefore an essential component of any model of college reading as it recognizes that reading instruction cannot merely be relegated to the earlier grade levels.

Funds of knowledge

Funds of knowledge (González et al., 2006) are construed as the cultural capital learners bring to the literacy events of formal educational contexts. Students' funds of knowledge can be described as academic and personal background knowledge, accumulated life experiences, skills, knowledge used to navigate everyday social contexts, and world views structured by broader cultural, historical, and political social forces (Kiyama and Rios-Aguilar, 2018). Because students all have prior experiences, they also have variable examples, data, stories, and ways of understanding the world that influence their conceptual understandings, or schema, about the world. Working from a viewpoint of Whorf's cultural and linguistic relativism (Carroll, 1956), certain cultural schemata are valued more highly than others; thus, power to determine the value of knowledge and knowledge systems resides with those in charge.

However, when instructors are aware of cultural differences that constitute different ways of knowing, they can benefit from engaging with the resulting diversity that is present in every classroom. Likewise, students who perceive that their instructors value what they each uniquely know, self-esteem, risk-taking, and achievement can be enhanced. But these alternative ways of seeing, knowing, and doing knowledge acquisition must be valued multiply, in their many forms, habits, and vocabulary for knowing, not just a convenient nod toward holidays, recipes, and costume parades. Specific to the writing of college students, Canagarajah (2011) suggests translanguaging approaches engage with funds of knowledge within transactional relationships and operate from negotiated achievements of meaning. Pacheco and Miller (2015), as well as Wiley (1996), suggest the same approach, even of younger students. The inclusion of funds of knowledge necessitates a democratic learning stance.

Perspectives focused on language/text valuing

Academic literacy, disciplinary literacies, and professional literacies

The literacy practices, routines, and values of professionals have been adopted as aspirational goals for textualizing in college reading through the construct of academic literacies (Lea and Street, 2006), and, more recently, disciplinary literacies (Shanahan and Shanahan, 2008; see also Bean et al., 2018). Whereas an academic literacies model, as explained by Lea and Street (2006) "is concerned with meaning making, identity, power, and authority, and foregrounds the institutional nature of what counts as knowledge in any particular academic context" (p. 369), disciplinary literacies as a perspective values the tools (processes and text types) that are specific to particular disciplines, such as history, chemistry, and mathematics (Shanahan et al., 2011). Even as college students learn strategic forms for writing, reading, and studying, the very reading habits and rhetoric guiding these processes differ across different subject areas. The tools used for communication purposes are driven by various domain-specific epistemological perspectives (Lee and Spratley, 2010; Moje, 2007; Shanahan and Shanahan, 2012). Although the disciplinary literacy literature stops short of defining what counts as a text, it does refine notions of what is valued, based on communication norms within a discipline. As evidenced by its very name, but also by the foci of so many expert reader studies (history, chemistry, mathematics; Shanahan et al., 2011), it is clear that what is privileged in disciplinary literacy are reading and writing in traditional academic disciplines. However, the college context spans well beyond traditional academic areas, particularly in community college and technical college contexts. Indeed, in areas of career technical education, the literacy practices present a different set of needs that go beyond traditional text structures and demands requiring unique competency and practices might be classified as professional literacies (Armstrong et al., 2021).

Vernaculars

Literacy learning should be in a constant state of change in its accommodation to the individuals practicing with it. Likewise, the building blocks and metaphors for literacy also flex with use. One specific approach to individuals' literacy development is the area of vernacular literacies. Vernacular refers to the everyday uses of language by participating individuals (see also Gee, 2001 and the construct of primary and secondary discourses), which makes it similar to funds of knowledge, but is more explicitly focused on language.

Respect for vernacular language and literacy recognizes and values the productive literacy practices students have learned and used at home. Therefore, college learning would use and value the "home talk" of its participants as resources in learning. Used by Ivanič et al. (2009), the term vernacular literacy in college learning discourses urges us to value and consider college students'

non-academic versions as communication that teachers accept and negotiate. The successful use of “the vernacular” inside of more restricted rhetorical practice of formal schooling would be successful border crossing. Ivanic also uses the term “border literacies” or

reading and writing practices in other domains of students’ lives-home, work, community-that are, or have the potential to be, situated also in the educational domain, and may therefore be mobilized to support student learning (p. 22).

From our uptake of the recommendations made by Ivanic et al. the use of vernacular language must be layered in social or learning contexts, so that from a pedagogical perspective, the vernacular evolves.

One model in which such a shift has been successfully conceptualized is translanguaging (Bernfeld, 2020; Garcia and Sylvan, 2011; Inoue, 2020; Young et al., 2018). Like recommendations for vernacular literacy, translanguaging “workshops” language use, substituting gateways of “correct usage” with shared communication as the goal. All language resources (vernacular, dialect, registers, as well as additional languages) are deployed to solve communication issues. Interestingly, Otheguy et al. (2015) suggest that it may be more productive to stop thinking in terms of discrete languages and instead focus on the collection of undifferentiated language aptitude and resources carried by all participants, students as well as teachers. In any case, students will certainly benefit from fusing their vernacular literacy in combination with those literacies valued by schooling (Ivanic et al., 2009). But it is not clear how those same students learn to do so, nor if specific instructors will be amenable, or even permitted for vernacular and less formal literacies in school contexts.

Multimodality and new literacy studies

More recent sociocognitive approaches to literacy have increased the purview of texts with multimodality and with New Literacy Studies. Mainly concerned with characteristics of the texts, multimodality focuses on the uses and creation of texts, while pointing out the various modes (image, sound, gesture, etc.) that convey meaning. Texts are broadly reconstituted as organized semiotic systems that communicate information via recognizable, shared, and predictable signs. This semiotic perspective is in stark contrast with literacies based on more traditional alphabetic texts. Of course, traditional texts were also always multimodal, with images, tables, as well as the meaning-making practices of their readers. The meaning-making processes of traditional texts (particularly, traditional paper-and-pencil, or keyboard-and-printer texts) are not lost in multimodal ensembles but elaborated and enhanced by texts from other modalities. Yet, with the inclusions of multiple modes and multiple materials of conveyance, little attention to postsecondary, and especially career technical education contexts, has registered in the studies and theorizing emanating from multimodal stances.

Primarily concerned with the *uses* of texts, that is, how texts are used in different social contexts, New Literacy Studies (NLS) derives from systematic, qualitative inquiries into the use of textual materials. From the premises of NLS (Knobel and Lankshear, 2007), text has also been impacted by multimodal influences to include many different kinds of texts that include visual texts, audio recordings, performances, as well as a plethora of objects that present information to “readers.” But even more importantly, the collection of social practices, which came to be known as literacy events (Heath, 1982), has problematized the very notion of autonomous literacies, such that literacy practices are now seen as socially grounded (Street, 1995). Although much of the progress in NLS has come from systematic ethnographic research into social practices with literacy, no recognizable body of work has been focused on postsecondary cultures. Indeed, the social practices with various objects in these fields are ripe for inquiry in the ways the objects are used as texts. This has simply not happened. One promising foray into text/object explication comes from researchers and writers in anthropology and performance studies (see section on **Entextualization**, below).

Perspectives focused on the expectations and purposes of the college context

Contextualization

Mistaken assumptions regarding the work of college reading in instructional contexts point to skills-oriented and therefore remedial practices. Such assumptions, however, ignore the actual expectations and purposes for reading in the college context. A functional context approach calls for development of curriculum that focuses literacy within real-world contexts. Such an approach facilitates students’ learning within the instructional setting and encourages transfer of learning to situations beyond the setting as well as the course itself (see Goldberg, 1951; Roueche and Roueche, 1993; Shoemaker, 1960; Sticht, 1975a,b, 1997; Sticht et al., 1987). Recently under *The Workforce Innovation and Opportunity Act* (2014), Integrated Education and Training models concurrently provide literacy activities with career technical training in specific occupational clusters in models such as I-BEST (see Hirschy et al., 2011; Zeidenberg et al., 2010). The use of contextualization must by its nature include the construct of intentional transfer as the purpose for learning particular literacy practices is two-pronged: learning for the immediate course goal of content mastery and learning for the long-term purpose of civil and workplace success.

Entextualization

The term was first coined by [Baumann and Briggs \(1990\)](#) in performance theory to capture the idea that performers must assess a situation (e.g., read the situation) in order to gauge their current performance and plan for the next action in their sequence of presentation. In effect the performers turn the setting into a text and read it in order to know how to proceed.

In the career technical education environment, composers of messages (communication of multiple varieties) must similarly “suss out” which objects can be productively used as texts (any item that carries needed information), how to read (process) the texts chosen, and then how to use the information with the projected audience. The items that occur in such contexts (any context for that matter) that have pertinent information and can be productively, reliably read, are called entexts. These are the objects like a drip bag, a cam shaft, a thermometer, a hemline, a recipe, all of which are interpreted (read) for vital information in the conduct of literacy events within the disciplinary contexts. Far from assumptions of discrete-skills instruction and remediation of deficiencies, then, reading at the college level requires sophistication in analysis and interpretation. It is, in short, a juggling act of intellectual creativity with a variety of information-bearing objects.

Positioning theory

We include one final perspective here that must be considered in conversations specific to the context and purpose of college reading. For this, we circle back to the very first perspective in our list of eight: lifespan literacy. It is the unfortunate present—and historical—reality that college reading carries a low status as both a field of professionals and as a needed area of instruction in postsecondary contexts. That reality must be captured in any model of college reading.

In descriptions of the social contexts that house disciplinary literacies and professional literacies is the notion of users’ positioning. [Harré and van Langenhove’s \(1999\)](#) positioning theory, a hierarchically organized theory of power distribution, analyzes individuals’ relative positions within bounded social contexts. The theory can be broadened to consider organizations, institutions, or fields of inquiry ([McVee et al., 2019](#)). Indeed, history demonstrates that across the past five decades since the coming of the developmental education field that college reading as a field and as a faculty have suffered from low prestige and lack of security within higher education. Scholarly elitism, academic elitism, or the privileging of traditional general education disciplines continue to define “academic literacies” as the fields with prestige, with physical books serving as the prestigious texts. Such bias is alive and well in US higher education.

Additionally, positioning must be considered from the perspective of the relationship of students as readers with faculty as conveyors of text and text practices. This is particularly relevant if students are expected to be fully text ready from the first day of a course rather than faculty anticipating the need to apprentice students across the duration of the course to develop the necessary disciplinary literacy and/or professional literacy competencies so as to achieve student learning objectives. It is problematic, to say the least, that reading is simultaneously low status to the point of invisibility, yet also the single most widely used learning mode in college contexts.

Conclusions and future directions

We suggest that while the postsecondary community at large may have expectations of the need for reading competency, it is not cognizant of reading’s foundational role in the culture of the institution and most certainly as represented by the constructs covered here. Though these constructs do not yet offer a comprehensive explanation for reading at the postsecondary level, the perspectives we have offered are intended to begin to describe the present state of college reading and to begin to shape pedagogical needs for acknowledging the specific—yet varying—reading and literacy demands, expectations, and practices represented across the postsecondary context.

The field of college reading has work to do to debunk myths that reading is mastered in the primary grades and to reverse assumptions that suggest it is socially acceptable to extend writing and mathematical instruction into the college years, but that doing the same with reading is simply remediating deficits. Specifically, especially if there is to be an intentional shift toward more assets-based approaches to creating student-ready campuses (as opposed to the more deficit-oriented notion of “college-ready” students), then more research is needed to effectively shift social and political assumptions that reading instruction at the postsecondary/tertiary level—and thus a field of professional experts—is unnecessary. This work is necessarily multifaceted, given the complex and varied nature of both the field of CR as well as the actual realities of reading in college worldwide.

First, broader explorations of developmental and remedial education globally will necessarily shape these conversations; key examples of this have been ongoing in Italy ([De Paola and Scoppa, 2014](#); [Sgobbi, 2019](#)). Second, problematizing the notion of ‘readiness’ has certainly been a staple of this work, as [Luoch’s \(2017\)](#) study of students at the United States International University-Africa in Kenya indicates. Third, more focused visibility needs to be drawn specifically to reading. This will include both a focus on the literacy experiences students bring to postsecondary/tertiary education as well as the reading demands student encounter within higher education. Toward the former focus, studies with Turkish university students have focused on reader profiles and habits ([Alan, 2020](#); [Erdem, 2015](#); [Odabaş et al., 2008](#); [Solmaz, 2018](#)) whereas [Trigos-Carrillo \(2019\)](#) has explored the need for academic literacies to take into account family and community literacies for first-generation college students in Latin America. Toward the latter focus, studies of 1st-year university students in Belgium have emphasized the literacy expectations students will face ([Heeren et al., 2021](#); [Van Houtven et al., 2013](#)).

Regardless of the particular context, reading is a key success factor for learners in nearly all formal postsecondary/tertiary education. This, coupled with the realities of the increasingly noticeable internationalization of higher education, is indication that more work on reading in college is needed and that perspectives from experts doing the work of CR globally must do better toward collaboration.

Herb Simon, of noble laureate fame, wrote often regarding the intersections of research, science, and practice in the realm of higher education (Simon, 2019). He distinguished between research that explores “what is” as contrasted with research that engages with “what could be.” The latter form of research he framed as driving the “sciences of the artificial.” “Artificial” here refers to the construction of things—not artificial in the sense of fake or unreal. Simon argued that engineering, for example, is one of the sciences of the artificial. Engineers, for example, make things in their research such as computer scientists building more powerful algorithms for data processing. Simon was not opposed to sciences that explore the “what is”—as in a psychologist’s efforts to understand the mind or a geologist’s efforts to understand the earth’s elements through research. He was just opposed to the lack of attention to and misrepresentation of the sciences of the artificial as derivative and less theoretical.

The field of education, for all kinds of historical reasons, has been primarily rooted in the academic discipline of psychology—a field of inquiry focused on how the mind works. I will make the argument here, that this historical tie has sometimes diverted educators from a much more powerful path toward research, science, and practice. Education is an artificial science. As educators, we strive to improve on the tools, systems, structures that serve the needs of children, youth and adults through design and redesign. We can draw on the knowledge generated in the traditional sciences (e.g., psychology, sociology, anthropology, child development), but our research could become much more powerful through a focus on improving practices using a design lens.

I will argue for a “what could be” vision for the relationship between research, practice, and literacy teacher preparation. In constructing our argument for a break from the traditions of psychological research, I will offer examples of research from my own work most often conducted in association with research colloquies. The focus on literacy and teacher education reflects my history as a literacy teacher educator. I subscribe to a philosophy of teacher preparation as a space for transformative change that impacts practice—not “teacher training” that prepares the next generation of teachers to replicate what is. Consistent with the call to make this *Encyclopedia* more international in perspective, I will offer examples of our own design research efforts both in the United States and in Southern Africa. This vision offers alternatives for literacy teacher educators to re-imagine who we are in the construction of scientific knowledge and the roles we play. This vision does not come with a promise of quick fixes to the challenges we face in education. A design perspective is typically iterative with progress realized in small increments.

Characteristics and principles of design research

Research into practice

In 2020, I participated in the Literacy Research Association’s online conference in this COVID era. Here are some variations on a theme I heard again and again: “How do we get teachers to do what research says is best practice?” “Why don’t teachers pay more attention to research?” “Research shows that what most teachers are doing in their classrooms does not reflect best practices from research.”

Underlying these kinds of questions is the view that it is the work of researchers to study processes like literacy and make claims that practitioners are expected to take up and use. This is research into practice. Sub-themes of these questions include:

- Compared to other approaches and methods, my research shows mine is better (than X, Y or Z);

- Do it with fidelity (just the way we did it in my research); and,
- Trust me ... what that other researcher is claiming to be true is not.

The subtext in all of these statements is about researchers as more informed, more capable, even more intelligent than practitioners. The subtext is also about the view of “best practices” as a real thing. Of course, this is not a new theme, but it has become more consequential during a time of mandates from national (e.g., No Child Left Behind and Reading First) and state initiatives (e.g., legislation in Texas regarding the training of all teachers in the LETRS program). Is it any wonder that practitioners become exhausted in their efforts to sort out sometimes competing claims, and become increasingly cynical in the face of the research treadmill coming to regard researchers as out of touch with reality? Is it any wonder that practitioners regard themselves as objects in a system that offers no space for them to contribute?

Research in practice

Just the simple adjustment from “research *into*” to “research *in*” practice leads us to consider a very different perspective on research and practice—one that is very much aligned with Simon’s sciences of the artificial. This version of research and practice was explored by Lewin (1946) in the form of action research. Lewin was very much about understanding complex systems (like teaching and learning) as they can be studied in context—not by isolating and attempting to control variation. For some time, this notion of action research was taken up as “teacher research” (Cochran-Smith and Lytle, 1993). Unfortunately, this well-intended shift became a euphemism for “second class” research—not theoretical and not worthy of attention. Fortunately, there has been a shift away from the term “teacher research” to “practice-based research” (Sailors and Hoffman, 2019). This shift is more than just relocating traditional educational studies into teaching and learning context (e.g., comparing method a and b), but to a different paradigm for research referred commonly as design research (e.g., Bakker, 2018; Van den Akker et al., 2006) and in other circles as “improvement sciences” research (see, Bryk, 2015; Lewis, 2015). According to Gutiérrez et al. (2017),

... research is being reconceived in ways that decenters the researchers, and reframes the aims, goals, and outcomes of research. In particular, this body of work foregrounds important principles about knowledge production and tries to advance a new generation of methods with new sensibilities (p. 36).

To be clear, this contrast between design research and traditional psychological research is not about a qualitative vs. quantitative tools and methods. Design research is guided by empirical data gathered and interpreted with the same level of rigor as in traditional psychological research (Sailors and Hoffman, 2019). Some of the important characteristics of design research include:

- Studies emerge through problem posing in practice.
- Studies are situated in the context of practice (nothing is controlled artificially).
- Studies are directed toward the improvement of outcomes.
- Studies are iterative with changes introduced to increase effectiveness—some of these interactions are planned in advance and others might emerge.
- Data collection and interpretation processes are continuous and rigorous.

Design research does not focus on the “best” only on the “bettering” or “improving” of practices. Design research also takes a fundamentally different stance from traditional research related to generalizability. In traditional research, probability theory is used to judge, within confidence parameters, whether a finding observed in a particular study can be generalized to a larger context (for a critical analysis of the assumptions made in this argument, see Carver (1978)). In contrast, design research strives to identify “design principles” to guide not prescribe similar efforts in other contexts. Replication of a study in other contexts is expected to yield adaptations to that different context and the discovery of, or modification of principles.

Simon writing on the sciences of the artificial reached across professional worlds and spawned a movement that is still growing. At the Environmental Design Research Association conference in 1969, Simon explained:

1. That representation of design problems holds the key to their solution.
2. That the complexity of design can be tamed by representing problems in smaller more manageable and potentially well-defined sub-problems.
3. That the packaging of information that goes on the human memory systems is universal, and
4. That the style of the designer is a function of her process (Akin, 2001).

We would argue that education, literacy teaching and teacher preparation, are best situated under this umbrella of artificial sciences and that Simon’s points made to the environmental research community apply equally well to our work as literacy teacher educators.

Literacy teacher preparation

To illustrate this process of design research, I will draw on three programs of research we and other close colleagues have been directly involved with over the past 20 years. I identify as university-based teacher educator. I study my own practices with the goal of improving teacher preparation and, ultimately, the transformation of literacy teaching in schools.

Literacy mentoring in hybrid spaces

University based teacher educators have struggled over decades with the “great divide” between academic preparation and field experiences (Horn and Campbell, 2015). Studies in the late 1960s and early 1970s revealed that the most common model for literacy teacher preparation involved a combination of foundational courses and methods courses typically delivered in lecture format on university campuses followed by one semester of field experiences (i.e., student teaching). Research into the effectiveness of these programs revealed that the student teaching experience shaped the preservice teachers into the traditional practices in classrooms and away from the innovative methods espoused in the academic courses. Over the next several decades there was an increase in early field experiences that were more carefully associated with the methods and philosophies introduced in the academic courses (Zeichner, 2010; Zeichner et al., 2012). While a significant step forward, Britzman (2012) has cautioned that a simple increase in uncritical placements in field settings as part of preservice teacher preparation may only serve to further compromise the transformative stance for change through the “practice makes practice” phenomenon.

In our recent work, we have begun to explore the promise of hybrid spaces as contexts for introducing transformative practices. What began as “reading tutoring” in a single methods course in our teacher preparation program gradually expanded into literacy mentoring as a core set of literacy teaching experiences that spanned the entire program. Over the course of more than ten studies—each study an iteration building on the previous work, I articulated a set of design principles for mentoring that are evidence based and inform our practice (Hoffman and Mosley Wetzel, 2017). With each iteration we found ourselves dealing with more complex issues—as in the hybrid mentoring spaces as contexts for introducing practices not found in the typical classroom placements (e.g., work with inquiry) to specifically address the kinds of concerns raised by Britzman. We do not have a “best” mentoring program for others to reproduce, but we do have a set of principles grounded in data that have grown throughout practice that others can explore and take up in their own context. These design principles are as follows:

1. Design the structure for the mentoring experience explicitly and intentionally to encourage engagement with transformative teaching practices.
 - Strive for a balance between a planned structure (models and expectations for work in certain areas and methodologies) and flexibility (spaces for being responsive) and for the preservice teacher to modify and adapt in their work with students.
 - Provide ample time in sessions to allow for relationship building and deep engagement with content.
 - Consider multiple, varied (e.g., location, participants, focus areas), and cumulative mentoring experiences across the program of preparation.
 - Connect explicitly toward concurrent and future classroom clinical experiences in literacy.
 - Provide spaces for innovative practices that include work with critical literacies, multimodal literacies, and digital literacies.
2. Build on the intellectual and socio-cultural assets and identities of the mentor and the mentee(s).
 - Focus on the importance of building a trusting and caring relationship between the mentor and mentee to encourage risk-taking.
 - Emphasize assessment practices that are appreciative of, building on, and responsive to the resources that mentee brings to the mentoring context.
 - Attend carefully and explicitly to the work of identity building for both the mentor and the mentee (“I am a reader who ...” “I am a writer who ...” “I am a teacher who”
3. Attend to the mediating processes that can support growth in a particular context.
 - Be present as teacher educators leading this work are present and interact directly in both academic coursework and in mentoring through coaching support.
 - Reflect in, on and for practice to encourage to support growth.
 - Nurture a community of practice that brings preservice teachers and teacher educators in spaces to grow together.
 - Connect mentoring directly to academic coursework and provide contexts for exploring pedagogical content knowledge, culturally responsive material, and culturally sustaining teaching frameworks.

The fact that we have articulated these design principles, does not mean our work is finished. We continue to explore how we can explicitly support our preservice teachers in moving the transformative practices into their early classroom field experiences and clinical teaching.

Coaching with CARE

As we moved our teacher preparation practices more deeply into the field in both hybrid spaces and classroom-based practicum experiences, we encountered a new set of contradictions that demanded design work. The coaching support offered by cooperating teachers to their preservice teachers was often coming from an evaluative model that reflected the ways in which these teachers were being coached (clinically supervised) by their administrators. Even the coaching support from the university supervisors was often coming from an authoritative space—just different from the cooperating teachers in the referencing point for what was “good practice.” Preservice teachers working in this context were often left to sort through the conflicting messages and walk the tightrope safely through to program completion.

We saw coaching support as critical in our mentoring work with preservice teachers but found the need to go beyond the evaluative “two glows and a grow” approach (e.g., “Here are two things you did that I liked and here is one thing you need to change . . .”) to explore more reflective models of coaching that would carry over into classroom teaching and life-long teacher development. Across a series of studies, we explored iterations that involved such changes as more intentional work with our preservice teachers on the

coaching model; preparing cooperating teachers to carry forward this model into classroom experiences; video supported coaching; and coaching practices that involved cooperating teachers, university supervisors and preservice teachers working collaboratively. We refer to this model as “Coaching with CARE” (Wetzel et al., 2017).

Through our studies of Coaching with CARE, all drawing on a design research basis, we inferred a set of design principles for coaching and mentoring preservice teachers (Mosley Wetzel et al., 2020).

Existing literacy teaching practices in the placement classroom must be critically examined as a starting point

Cooperating Teachers building a deep understanding of their own teaching practices through inspection, observation, and reflection.

Developing trusting relationships through caring for/with preservice teachers

Caring with and caring for are necessary elements in developing trusting relationships for coaching.

Reflecting within a community

Coaching includes reflecting for practice (before teaching), during practice, and after practice. Reflecting around action is a process that includes the ongoing conversations about literacy teaching and learning that are part of the double loop and triple loop reflection.

Using video and student work to focus on students as a source of feedback

Build a tool kit for exploring tensions in literacy teaching—video and student work—as a means to hold practice still. The use of video in coaching we call RCA translates directly to retrospective video analysis (RVA), a tool that practicing teachers can use in their classroom (Mosley Wetzel et al., 2017).

Building practices for disruption and critical conversations to build more equitable classrooms

We have drawn more and more on narrative approaches to analysis along with discourse analysis to understand the ways that teachers make space for narratives in their coaching and how those narratives become opportunities for critical work around the topics of literacy and social justice.

As with our work in mentoring in hybrid spaces our work with the coaching support process is unfinished. What has become increasingly intriguing to us is the impact of these mentoring experiences on the classroom teaching practices of cooperating teachers in their interactions with their own students.

The BETTER project in Mozambique

Over the past 20 years, we have been involved in multiple research and development projects related to literacy teaching in schools. The Ithuba Project in South Africa (see <https://www.utsa.edu/ithuba/Frames/Home.html>) and the READ Malawi Project (see <https://www.utsa.edu/readmalawi/>). Both projects focused on the development of instructional (supplementary) books for children in official languages to support literacy learning (Hoffman et al., 2016; Sailors et al., 2009, 2013a,b, 2014, 2010, 2012; Sailors and Kaambankadzanga, 2017; Shin et al., 2020). In all this work we have been conscious of our position of power (through control over resources) regarding teaching practices “imported” from the outside into local contexts. We have resisted, what Easterly (2006) described as the “planner” model for international development work where solutions to problems posed by outsiders are implemented on a broad scale. Our goal and process has been to take what Easterly described as a “seeker” stance that involves recognition and collaboration with local expertise. All of the materials we have worked to develop in the Ithuba, and Read Malawi books were authored by local educators, edited locally, and printed in countries. All the staff development work associated with these materials was planned and organized collaboratively with local partners.

The BETTER project in Mozambique marked a shift in our work from materials development to teacher preparation (Sailors and Hoffman, 2019). While the larger BETTER project is focused on promoting interactive methodologies in teacher preparation, our small portion of this project has focused on supporting hybrid mentoring practices with one local teacher training institute. We brought forward into this context the design principles we had developed in our mentoring research. Through our intensive work with one local teacher preparation site over 3 years, we were able to develop a model for mentoring in hybrid spaces that reflected the local spaces, context, and resources. We developed videos and other support materials (e.g., assessment tools) that could be used in the work at additional sites across the country.

Our work in Mozambique has built on and extended our understanding of mentoring in hybrid spaces in two areas. First, the bulk of our work in literacy teacher preparation has been in the area of English. In Mozambique, Portuguese was not the home language for either then mentors or the mentees. It was rare that there was even a shared home language between the home languages of the mentor and mentee. The design principle emerging for us is the need for careful negotiation between the mentor and mentee between indigenous and the “official” targeted language as literacy practices are explored and developed.

A second, emerging design principle related to the insider/outsider expertise and positionality with respect to leadership and guidance. We were extremely fortunate to have partnered with a local teacher educator who quickly stepped into a leadership role in the mentoring project. She adapted and improved the process for both the mentoring and the preparation of the mentors.

She became the leading voice in work with other sites around the country that were interested in adopting the mentoring model. Our voice and experiences were influential but not central to the process as it was taken up and expanded.

Considerations and cautions in a design research agenda

There is nothing special in our work with design. There are other literacy researchers doing design work (see [Gutiérrez, 2018](#); [Reinking, 2021](#); [Bradley and Reinking, 2011a,b](#)). There are also educators engaged in design research without “naming” their work as research, without guidance in how to study their professional work in ways that contribute to our knowledge of practice. Evaluating studies, in the past, were regarded as not theoretical and of lessor value than traditional research paradigms. This view was disrupted by [Reinking and Bradley’s \(2008\)](#) careful articulation of formative design research. In thinking toward a future driven by design research, there are three considerations we would raise for deliberation.

Imagination in design research

The more we have worked with the “what could be” stance toward our research, the more we have become aware of the critical role of imagination in the design process ([Sailors, 2018](#)). Imagination in design research demands that we step outside of the assumptions that have led to the identification of a particular “problem” for study into a more expansive process of problem posing. [Gutiérrez and Penuel \(2014\)](#), for example, describe imagination in relation to design research in critical spaces of transformation. They contrast this approach with traditional approaches to research. Studying the “social life of interventions” moves us away from imagining interventions as fixed packages of strategies with readily measurable outcomes and toward more open-ended social or socially embedded experiments that involve ongoing mutual engagement (p. 20). The focus is on seeing everyday practices in new (and critical) ways and then using design research to explore the “what could be.”

Collaboration vs. scale in design research

Issues of scale are of importance in educational research that draws on traditional psychological models. Large is better, more trusted, and more consequential. Findings from large studies (e.g., with huge sample sizes, systematic sampling, and associated generalizability across contexts) are viewed as the gold standard for research (see [Torgerson and Torgerson, 2001](#)). Design studies, in contrast tend to be small in scale and local. Context is not eliminated or controlled but studied for its influence. The power of design research comes in the interaction of researchers across different contexts engaging with similar challenges and similar design paths. Robust design principles emerge across these contexts. We are currently working as part of a collaborative of researchers at ten different universities engaged in the study of literacy mentoring in hybrid spaces and the impact of preservice teacher development. We have developed shared instruments to use across our sites. We have flexible clusters of institutions researching different contexts for mentoring. We are looking across sites at our findings to generate design principles that can be used to inform practices. This is new and exciting territory for those of us raised in the context of experimental research traditions.

Publishing in the academy

Design research will be of no consequence if it is not shared broadly in scholarly circles. While there are important examples of design research published in academic journals (e.g., [Neuman, 1999](#); [Neuman and Dwyer, 2011](#); [Roskos et al., 2011](#)), these publications tend to adopt of formative design experimental approach to design research (close to traditional psychological research) rather than more expansive versions of design research such as in Engeström’s developmental work research ([Engeström, 2016](#)).

There has been promising work in the scholarly literature. For example, *The Journal of Operations Management* created a new “design science department.” In addition, [Van Aken et al. \(2016\)](#) wrote an inaugural essay describing the qualities and characteristics of what they term DSR (Design Science Research). According to [Van Aken et al. \(2016\)](#), the key questions of validity and relevance are “(a) How strong is the evidence that the design will produce the desired results? (i.e., pragmatic validity); and (b) In what way does the design make a valuable contribution to addressing a significant field problem or exploiting a promising opportunity? (i.e., practical relevance)?” (pp. 1–2). They argue that DSR is a research strategy with an aim toward generic design and the workings of the design. They explain that the differences with more common research design is in at the strategic level not the tactical level. “There are, in principle, no differences at the tactical level of methods for data gathering and analysis” ([Van Aken et al., 2016](#), p. 8). We can aspire toward a future in educational journals may take a similar stance in promoting design research efforts.

Conclusion

Miriam Lewin, Kurt Lewin’s daughter, uses two of Lewin’s most quoted statements related to research and practice in her celebration of his work: “There is nothing as practical as a good theory.” And “If you want to truly understand something you have to try to change it” ([Lewin, 1998](#)). These statements, and Lewin’s work generally, embody the relationship of research and practice that I

have attempted to articulate here in relating research and practice. I would only extend his observations to include that: *there is nothing more theoretical than good practice*.

The sciences of the artificial should be about change and improvement. Reeves et al. (2011) present the case that while educational research has expanded exponentially over the past decades, so has the evidence of failure across the educational system continued to expand the differences between the haves and the have nots. How can this be? Because, they argue, we have been doing the wrong kind of research. The future is to be found, as we have claimed here, in design research.

- Sensory orchestration** The senses working together
- Touch** To bring the hands and fingers into contact with someone or something

Sensory literacies: senses, the body, and literacy practices

There is a long history of literacy research that has yet to explore the fundamental basis for human thought and language—the senses, embodied activity, and real-world referents (Gibbs, 2005). A sensory literacies paradigm is a recent approach that foregrounds the role of the senses and embodiment in literacy and communication practices—social practices that vary across cultures, contexts, times, and technologies. The sensory literacies approach was coined and described in the volume “Literacy Theories for the Digital Age” (Mills, 2016). A sensory approach to literacies advances understandings of literacy as a social practice with a focus on the body and the sensorium. However, it does so without taking for granted the role of the mind and the technologies that support literacy practices. Both the mind and body are seen as integral to literacy practices, consistent with embodied cognition (Mills, 2016). Theorists of embodied cognition have shown that even when abstract mental processes are in operation, the mind draws on integral sensorimotor processes that operate in the background to orchestrate images, sounds, movements, and memories (Wilson, 2002). In other words, even the so-called “thinking” part of literacy practices is body based.

A sensory literacies approach follows a move toward sensory scholarship across many disciplines (Stoller, 1997), influenced by sensory studies (Howes, 1991, 2003; Howes and Classen, 2014), sensory ethnography (e.g., Pink, 2015), and other tributaries of thought on literacy and the body in education (e.g., Mills et al., 2013; Scollon and Scollon, 2003). The theoretical basis of the sensory literacies approach follows a sensorial turn that has emerged in many fields of research, including, but not limited to, cultural anthropology (e.g., Howes, 2014), neuroscience (e.g., Murray and Wallace, 2012), cultural geography (e.g., Boswell, 2017), marketing (e.g., Hulten, 2011), law (e.g., Sculthorpe, 2014), sensory methodologies (Pink, 2015), and architecture (Pallasmaa, 2012).

A sensory literacies approach concerns the embodied and emplaced relations between humans, materials, texts, and technologies in the social practices of literacy. For the most part, the senses in education have been seen within the ambit of psychology, while literacy education has been somewhat ambivalent in terms of the senses, concerned primarily with the teaching of language

as text (Majid and Levinson, 2011). While some multimodal theorists have examined the visual semiotics of texts for many decades (e.g., Kress and van Leeuwen, 2006), recent work has examined embodiment and the senses in text encoding and decoding across a range of modes and media. For example, Mills et al. (2013) explored the under-researched role of locomotion and kinesics in children's film making. This work drew the attention of Howes (2016), a sensory anthropologist, who acknowledged the usefulness of such applications to theorizing literacy practices. Theories of touch and haptics (e.g., Bezemer and Kress, 2014) are relatively emergent within a sensory turn in literacy research, in part influenced by the move to touchscreen technologies, and supported by seismic changes to the use of touch and haptics in textual practices in the 21st century (e.g., Crescenzi et al., 2014; Walsh and Simpson, 2014).

Few would disagree with the assertion that "without our bodies—our sensing abilities—we do not have a world" (Arola and Wysocki, 2012, 3). A sensory literacies approach has opened up different ways of teaching, researching, and theorizing literacy practices in education, highlighting the way in which literacy practices are embodied, multisensorial, and interconnected to sensorial and placed action that differs across cultures and social contexts. A sensory literacies approach similarly accounts for the role of the body, the senses, and the mind in relation to reading, writing, listening, viewing, and creating meaning in digital and non-digital ways.

Privileging of vision in theories of communication

Western epistemic beliefs have for some time prioritized empiricism, which is established on the central assumption that observable knowledge—what can be repeatedly seen and confirmed with the eyes—is truth. This privileging of what can be perceived through vision has not been exempt from language and literacy studies, where ocularcentrism—the partiality toward the vision over other senses—has relegated the so-called "lesser modes" and "lesser senses," such as taste (van Leeuwen, 1997), smell or olfaction (Wasikul et al., 2015), kinesis or movements of the lower limbs and feet (Mills and Dooley, 2019), and even sound (Ceraso, 2014) outside the central purview of language and literacy teaching and research. While written and spoken words feature prominently in literacy curricula, and to a lesser extent, images and gestures in texts and performances, the marginalization of the so-called lesser senses of bodily movement and locomotion (Ingold, 2011), can be understood as part of the broader influence of empiricism and ocularcentrism across a range of disciplines (Howes, 1991; Porteous, 1990).

Theorists of sensory studies have provided enlightening critiques of the visual and textual bias of the Western episteme, recognizing that our cultural bias toward vision becomes apparent when researchers examine how "life is lived in other cultural settings" (Howes, 1991, 3). There are numerous examples in non-Western cultures that ascribe varied meanings to sensory experiences that are richly illustrative of multisensorial and socially organized meanings that matter, and that extend well beyond vision (see, for example, Feld, 1991; Pandya, 1993). Classen (1999) writes about the Desana people of the Colombian rainforest whose social and cosmic understandings evolve from the sounds of bird calls, the color and scent of flowers, and the taste of fruit. For the Warao of Venezuela, herbal plants of similar appearance used in pharmacopoeia are identified by their smell, because relying on visual means alone may be fatal (Wilbert, 1987). The point is not so much to establish an *anti-visualist* approach to literacy, but rather, to develop an approach to language, literacies, and communication that is able to reflect upon its sensory assumptions and hierarchies. A sensory literacies approach is catalyzing new understandings of the role of the full sensorium in the social practices of literacy, and the specialized roles and interconnectedness of the senses and modalities that are mobilized in meaningful and embodied ways—ways that are constantly shifting across cultures and time.

The privileging of vision in learning and communicating has far-reaching negative consequences. Multisensory research from the cognitive sciences has shown that restricting the use of the senses to vision results in perceptual processing deficits, as well as reduced efficiency for memory, learning and communication (Shams and Kim, 2012). Certain facts and types of knowledge are well-suited to visual representation, but other kinds of knowledge about the world are better suited to multisensorial combinations of modes (Stein, 2012). For example, in response to questions from his young Fijian students about the use of mangrove sap in making tapa cloth, the classroom teacher talked about the inherent benefits of taking the children for a walk to the mangroves to "witness the reality of it" and extend their initial understandings (Carss et al., 2015, 35). Consequently, privileging ocularcentrism in literacy research and practice limits avenues for students to communicate varied kinds of knowledge (Klatzky and Lederman, 1988).

A sensory approach to literacies had drawn attention to the interrelationships among the senses that are vital to meaning making. Ingold (2000) argues that "... the eyes and the ears should not be understood as separate keyboards for the registration of sensation, but as organs of the body as a whole" (268). Sensory approaches attend to multiple senses and their interrelationships in meaning making, also referred to as sensory orchestration—the senses working together. Literacy as an embodied practice involves aurality, touch, sight, movement, taste, smell and other forms of bodily awareness that are still being explored in research, such as thermoception, a sense of temperature, and proprioception, the awareness of one's body in space.

Embodied cognition and sensory studies: origins of sensory literacies

The theory of sensory literacies involves a paradigm shift from traditional views of language and communication in cognitive psychology that emphasis the neural base of language (Gibbs, 2005), to the theory of embodied cognition that examines the grounding of language in kinesthetic experiences (Wilson, 2002). The view that cognitive, social, and practical enactment of literacy is body-based draws upon the growing recognition that human perception, thought, and language are fundamentally shaped by embodied experience (Haas and McGrath, 2018). Literacy practices do call upon mental activities, such as the act of writing, which

can be considered as a vehicle for human thought; yet our thoughts constitute an array of internalized sensorimotor experiences and functions, operating covertly to simulate or reflect upon external events using visual, auditory, and kinesthetic imagery and memories (Friend and Mills, 2021). In other words, literacy practices, including the mental and practical work of reading, writing, viewing, designing and so forth, involve embodied cognition. Literacy is not the achievement of the mind inside a disconnected body, nor the body performing mindlessly, but involves a synergistic interrelationship between mind and body (Mills, 2016). Likewise, the body is central to the practical enactment of literacy practices in terms of their corporeality. As Scollon and Scollon (2003, 45) argue, “Our bodies as humans cannot fail to anchor us in the real, physical world in which we are performing as social actors.” Teachers capitalize upon this, seeing children’s physical cues to storybook read alouds as a means by which to make assessments of their ability to comprehend the text (Luke, 1992).

Cognitive theorists distinguish between two important forms of embodied cognition—online and offline. These are not to be associated with being connected to the internet. Rather, online embodied cognition refers to mental activity in which the mind is operating while the sensing body simultaneously interacts with a physical or virtual environment. Offline embodied cognition is the use of sensorimotor processes to support abstract, mental tasks, but operating in a covert way (Wilson, 2002). What is remarkable about human thought and language is that these ostensibly abstract processes in offline embodied cognition are also body-based (Friend and Mills, 2021; Gibbs, 2005). This is because learners have previously internalized sensorimotor functions to reproduce memories of external events, images, movements, music, language, and other resources that were learned or perceived sensorially. A classic example is mental calculations, where operations that were previously supported by counting on one’s fingers become pictured in the mind’s eye. Sometimes this can be accompanied by subtle movements, like twitching, but once the sensorimotor activity has been fully internalized, the mind can run a mental simulation of the movement (Wilson, 2002).

This is significant because the senses are not only vital to the corporeal aspects of literacy, such as turning the pages of a book, gesturing with hands, or writing with a pen, but to the abstract facets of communication, such as the internalized sensorimotor simulation of smells, sights, events, and ideas about the world that are described and remixed as one composes a written text. In contemporary literacy environments, where communication is often digitally mediated, literacy practices require augmented forms of online (practical) and offline (abstract) sensorial and embodied practices. Similarly, listening is not just the practice of attending to audible words or sounds in order to make meaning of them. Ceraso (2014) explains how other parts of the body, such as the stomach, throat and legs, can be engaged during a “sonic encounter” (102).

Likewise, even many words in language have a sensory basis because things seen, heard, felt, tasted, smelled, and perceived form the physical basis of meanings that are later mapped onto abstract metaphors. Sweetser (1990), for example, showed how polysemous vocabulary, or words having many meanings, in Indo-European languages that are sensorial, experiential, and physical, become extended or mapped semantically to become metaphors that have non-physical, abstract, and intellectual meanings. For example, “keep my ear to the ground, going in with your eyes open; dip your toe in; stick your neck out.” There are many examples in language etymology where bodily experiences undergird semantic meaning making. One can also detect the dominance of vision in the wide usage of the word “seeing” as “knowing” in English, which is also the case in Russian (Andrews, 1995; Gibbs, 2005). Examples in English are “I see what you mean; it’s my observation that ...; I’ve watched this unfold; From my viewpoint; Look at it this way; It’s in our line of sight.” The sense of sight is used in manifold ways as a metaphor for expressing and communicating cognitive understanding. Thus, embodiment and the senses are not only observably central to literacy practices, they are also central to metaphoric reasoning and many instances of semantic interpretation in the very etymology and evolution of language.

Use of the full sensorium in literacy and digital media practices

Literacy practices, digital and non-digital, involve the full sensorium—the human sensory apparatus or faculties as a whole. Literacy practices constitute the work of the mind and body in its entirety, involving interrelationships between different modalities that do not merely overlap, but which operate together as a synergetic system in social action. For example, creating a video can involve an array of embodied creative processes, including first drawing or visualizing a storyboard or sequence of still images, walking, and moving to different locations with the camera to gain different viewpoints, and filming scenes from different bodily positions. Dramatic performances may be included in the film, while scenes may involve narrating with the voice. Editing the film is typically enacted while seated at a computer to juxtapose audio, still or moving images, transitions, subtitles and other compositional elements (Mills et al., 2013). A broadened repertoire of digital technologies to mediate textual practices across modes, likewise, accompanies different forms of material and bodily engagement in literacy practices.

At the same time, the integration of the senses in literacy practices is neither new nor unique to practices mediated by digital technologies. For example, Indigenous cultures have long valued the integration of multiple ways of knowing about the world. Constance Classen concluded in her observation of the senses in Indigenous cultures, “Each of the senses has a vital role to play in the acquisition of knowledge about the world” (Classen, 1999, 269). Likewise, in Andean culture, the textile technology of the *quipu*—a set of knotted, colored cords suspended from string—communicated information three-dimensionally, with each color, position and size of the knots encoding different meanings (Howes, 2016). The creation of *quipu* was simultaneously an art form, a mnemonic device and a form of Inka writing, while each *quipu* maker had a signature style or shorthand, making the accurate decoding and interpretation of *quipu* from a vanished civilization near impossible. Ascher (2002, 133) argues that *quipu* was multi-sensorial, “simultaneously tactile and visual, and probably more.” The point is, that in older civilizations, knowing, and communicating about the world has involved multiple senses.

However, the increasing role of digital technologies in literacy and communication is unprecedented (Mills, 2010), and with these transformations have arisen new sensory affordances of technologies involving novel uses of haptics, movement, and other modes that are having a monumental impact on recreation, social life, and the workforce. For example, young people imitate rhythmic gestures, movements, and facial expressions with lip-syncing in short video sharing and social media platforms (Simsek et al., 2018). Virtual reality headsets and hand-controlled sensors open up a wider range of applications for communicating through kinesthesia—the sensory awareness of the position and movement of the body, particularly of the hands and arms (Mills and Brown, 2021). When used with programs such as Google Tilt Brush, creating three-dimensional, virtual artwork can be created in an immersive, whole-body, multisensorial environment (Mills et al., 2022).

Since time immemorial, literacy practices have been multisensorial, and at different times, a narrower range of sensory practices have been privileged over all others. Compare the Gutenberg era beginning in 1450 to the wide-ranging digital texts options of the current period. The convergence of electronic media with mobile technologies has seen the rise of interactive literary apps and other online forms of online reading on the internet and social web, with changing materially demanding different sensorial practices (Mills et al., 2018). Researchers have drawn attention to new typologies of interactive touch in e-book reading, such as the use of extratext functions (e.g., pressing an audio button to listen), and intratext interactivity, such as enacting part of the action of the plot or characters through tapping, swiping, shaking, or drawing thumb and fingers together or apart in pinching movements (Zhao and Unsworth, 2017). These digital versions of books, or other long form reading material, such as electronic magazines, journals, blogs, and news articles, are not rendering conventional printed book reading obsolete, rather, they contribute to the broadened variety of sensorial engagements for new reading practices.

Similarly, the sensoriality and materiality of writing practices are swiftly changing, even though writing has always been an embodied practice (Mills, 2016). Writing has been aptly called “language by hand” by educational psychologists to draw attention to both the serious cognitive work and the fine-motor skills (Berninger et al., 2009). Haas and McGrath (2018) explain how writing movements trigger activation of the brain, regardless of whether an individual actually provided a motor response. The act of writing by hand brings modes of visual and proprioception together in sensorial orchestration. It has long been established that sensory modalities and the creation of neural structures support the ongoing development of literacies (Haas and McGrath, 2018; James and Gauthier, 2006; Matsuo et al., 2003). In addition to the complex and difficult-to-observe neurological relations between a writer’s mind and body-based memories (e.g., Wilson, 2002), few would dispute that writing is embodied in observable, material, and corporeal ways as “writers pick up and chew their pencils, they rest their hands on keyboards, they hunch over manuscripts ... push keys or click buttons” (Haas, 1996, 226). Writers cannot produce text other than through the work of their bodies, while at the same time sensorial processes of writing involve more than the corporal interaction of minds, bodies, hands, mouths, eyes, pens, papers, voices and computers, employing a plethora of cultural and social practices that vary in nuanced ways across writing communities, from graffiti artists who inscribe walls, to children who write using a stylus and touchscreen at school (Mills, 2016). Theorists have similarly drawn attention to the fact that the embodiment of writing is different for able bodies than those whose bodies may not conform to ableist norms, challenging assumptions about the writing body (e.g., Dolmage, 2012).

Literacy practices are continually shifting, and with these changes come modified forms of embodied meaning. Each new social practice, such as using a virtual reality headset and sensors for the first time, involves learning new forms of embodied engagement in meaning making. Specialized competency can involve years of training. The enactment of literacy practices, like many social acts across all spheres of life, constitutes an array of embodied knowledge that may be acquired from birth, (e.g., early vocalizations, speech) knowledge that is taught and practiced in the socialization of cultural communities and societies, and which may become systematized over time. Likewise, the embodied nature of familiar literacy practices can become taken-for-granted or backgrounded with familiar and repeated use as socially learned repertoires of action (Mills, 2016; Mauss, 1979). In short, a sensorial approach to the integration of the senses moves away from disembodied views of literacy practices, while also resisting the hegemony of sight.

Implications of sensory literacies across the life course

The physical transformations of the senses that occur over one’s lifespan follow a progression, beginning in the womb. Medical scientists have documented reactions of the fetus in utero and pre-mature babies to confirm that humans of gestational age develop their sense of taste first, transmitting information from their taste buds to the central nervous system during the last trimester of prenatal development (Forestell, 2017). The fetus is receptive to and responsive to auditory and tactile senses, even if they are not aware of these perceptions (Bradley and Mistretta, 1975). The fetus is also sensitive to touch, sound, and smell. Visual receptors do not receive adequate stimulation until after birth (Bradley and Mistretta, 1975).

During gestation and after birth, the human brain continually integrates information from the difference senses to provide a “unified perception of the world” (King, 2007, 3), a process that is essential for directing attention and controlling movement of the body (Denervaud et al., 2020). Although the human brain has the capacity to selectively decrease amplification of some senses to concentrate on other senses (Petrini et al., 2020), the success of this undertaking is dependent on an individual’s capacity to bind together the most appropriate multisensory signals (King, 2007).

The specific development of the senses diverges in important ways in response to cognitive maturation, and environmental and contextual factors. For example, infants have a pronounced sense of olfaction, using smell to locate food sources (such as the mother’s breast), and being able to recognize the smell of their mother. An adaptive behavior study undertaken by Cavazzana et al. (2016) found that by age 5, young children were able to mediate the affective strength of olfaction with social information. Environmental factors responsible for different rates of multisensory development include diet, nutrition, and healthcare (Crafter

et al., 2019), as well as contextual factors, such as one's socio-cultural experiences. This means that the repertoire of sensory literacies evolves in particular and context dependent ways, coming to the fore in different combinations for different reasons over one's lifetime. For example, experiences during infancy shape the way the visual and auditory inputs interact to determine the responses of the neurons in later life (Wallace and Stein, 2007), and thus, the repertoire of practices an individual has available for a range of literacy encounters.

In old age, the adage "use it or lose it" takes hold, drawing attention to the need to maintain the use of the senses for communicating through ongoing sub/conscious practice. The rate of deterioration of each sense is not uniform. For example, when an additional language is acquired in adolescent or adulthood, passive recognition of vocabulary extends over relatively long periods of time. In contrast, for the same individual, "without consistent use, speaking fluency decays rapidly" (Hertzog, 2009, 162).

Pedagogical challenges and possibilities

The use of the full sensorium in communication is crucial for supporting and strengthening an individual's social competence, formal learning, and vocational expertise (Petrini et al., 2020). Growth of capabilities and competence with the senses in literacy practices is not tied exclusively to biological processes, but is also dependent upon a dynamic process of co-construction with others in their physical and virtual environment.

The need for a wide repertoire of sensorial ways of perceiving and communicating is important in the early years, as it is in the years of schooling and in vocational pursuits (Denervaud et al., 2020). Some Australian scholars have documented the reduction of multisensory learning environments in early learning classrooms due to the pressures of national assessments in the early years of schooling (Somerwil et al., 2020). Teachers working with diverse student groups, such as those with differently abled bodies, are challenged to think beyond conventional teaching styles. Mashimo (2019) reports on the enactment of a multisensorial pedagogy that involved "hands-on educational workshops" instead of the more traditional vision-centered approach to teaching art history. His work documents the challenges of this adjustment for the sighted students in his classes. Similarly, a recent study exploring the use of a sensory approach to learning and teaching in English as Foreign Language (EFL) lessons for Pakistani students documented significant growth in the development of students' speaking skills (Ghani et al., 2015).

Conclusion

While cognitive science has examined the neural basis for human language functioning, it is prudent to also consider research on language and cognition, giving due acknowledgment to the role of the senses and the body, including everyday kinesthetic experiences. Gibbs (2005, 159) has argued that ignoring this thinking "has seriously undermined scientific understanding of the relations between mind and body, and more specifically, linguistic meaning, communication, and embodiment." Literacy practices, whether involving reading, composing texts, performing, viewing, listening, or combinations of these and other capacities involves the corporeality of one's body that is situated in a physical, social, and cultural environment. For example, even the most attentive listener in a seemingly quiet audience will make subtle eye movements, postural shifts, and other fine-motor responses that often occur subconsciously, and which may be interpreted by the speaker. Conversely, the absence of a bodily response, such as a blank stare from a participant in a conversation, can also speak volumes (Gibbs, 2005).

However, perhaps more critically, all human thought involves previously internalized sensorimotor functions to reproduce memories of concepts and external happening, words, images, tastes, textures, smells, sounds, songs and ensembles of other resources that were learned or perceived sensorially. Literacy practices require the attention of a knowing mind, and a perceiving and sensing body. Literacies can be conceived as sets of transposable dispositions that are consciously or unconsciously acquired through one's socialization over the life course, embodied in one's mind and muscle memory in often taken-for-granted ways, and which are not independent of the senses (Mills, 2016). Certainly, vision plays a central role in many literacies, but not inherently so, and more often, multiple senses operate together, some foregrounded, others backgrounded.

In sum, this chapter has challenged the belief in certain fields of Western philosophy, cognitive science, linguistics, and literacy theory, that language and meaning making is a predominantly abstract, psychological process divorced from the body, and likewise, the understanding that the role of the senses and the body is merely backgrounded in language and communication. In contrast, we have demonstrated here through evidence from embodied cognition and sensory studies that human bodily and sensorial experiences are the fundamental basis for thought and language, which occurs alongside cognition as corporeal bodies interact with materials and others in tangible, cultural, and social worlds. At a time in history when "standard English" literacy valued in schooling has, for the most part been reduced, taught and tested in global and national standardized tests as an atomistic set of skills, a sensory literacies perspective draws attention to the way in which language and literacies are not best understood and researched as disembodied and purely abstract activities of the mind, but as intimately amalgamated with embodied action.

Since the late 1990s and early 2000s, connected, digital technologies that utilize the internet have expanded and changed the ways we engage with the world (Greenhow et al., 2009). Perhaps one of the most prominent ways has been to change our literacy practices. This change has had substantial consequences for K-12 learning, which requires the use of literacy practices across all disciplines (Leu et al., 2013). The increasing growth of digital technologies has given rise to multimodal methods of communicating, has enabled and demanded global participation and collaboration, and has expanded the spaces that we inhabit as we connect and communicate. These shifts are affecting the ways we read, write, interpret, and create. New literacies are needed to navigate the internet, and they require the nimble use of skills, strategies, and mindsets to navigate online in everyday contexts (Jacobs and Castek, 2018, 2022). Moreover, new literacies are necessary when locating online information, networking, or using texts, tools, and interfaces to accomplish personal and professional goals.

Literacy is central to all disciplines, and changes in literacy practices have implications for the ways we design and engage in instruction, teaching, and learning across all fields of study. In this chapter, we consider how reading and writing change on the internet and the implications of such changes. We also discuss some of the ways that reading and writing—or, interpretation and creation (Forzani and Ly, 2022)—shifts online. To do so, we first begin with an overview of theoretical work that has impacted the ways we think about new literacies with the internet. We then discuss characteristics inherent in an internet environment and the affordances, constraints, and implications associated with these characteristics. Next, we examine how the internet has shifted our social values and the ways in which these changing social values are now reflected in curriculums around the world. Finally, we consider under-realized potentials in the field and avenues for future research.

Examining the new literacies of online of reading and research

The online world is social, and the definition of literacy is evolving due to the prevalence of digital texts, tools, and applications that are ubiquitous within daily interactions (Leu et al., 2013). Online networks, search engines, friends, and family are places people turn to when seeking information or attempting to solve a problem in everyday life (Jacobs and Castek, 2018, 2022). Information seeking involves deep levels of critical thinking when examining different websites and resources, determining which ones are most useful, and deciding which information within any given resource is relevant to the purpose (Goldman et al., 2013). In addition to thinking critically about information, learners also need to rapidly shift perspective and adapt their skills to complex situations they have not encountered before. Kiili et al. (2018a,b) and Coiro et al. (2019) frame online reading as an activity that involves curiosity, inquiry, and learning how to learn within ever-changing digital environments.

The digital world introduces greater complexity of meaning-making, as there are now more texts, text types, tools, modalities, creators, and a greater range of information quality online (Coiro, 2020). Such complexity can be both supportive and challenging. On one hand, this variety of literacies allows people to have some choice and control over the kinds of literacies they use and when and where they might “enter into” a literacy activity. For example, someone might choose to learn about news through videos if they cannot read in a particular language. In this sense, multiple modes and text types can be more engaging and accessible. People now have to learn not just how to interpret ideas within a single literacy but also how to use combinations of different literacies across multiple, rather than single, texts. At the same time, people are required to learn how to create using many different modes, text types, environments, contexts, and tools resulting in more complex and more challenging meaning-making processes (Kress, 2003, Chapter 4; Coiro, 2020).

A dual level theory frames two levels of new literacies: lowercase (*new literacies*) and uppercase (*New Literacies*). The term lowercase new literacies refers to a specific literacy area or technology, such as the literacy practices used within social media platforms or even within a particular social media platform such as Twitter. Lowercase new literacies also can refer to a particular area of study, such as data literacies, the literacies of social media, or networking literacies for navigating learning environments, career possibilities, or among multilingual individuals from around the globe. Understandings about particular lowercase new literacies can inform our understandings of other lowercase new literacies. To capture such similarities across lowercase new literacies, Leu et al. (2013) use the term uppercase New Literacies to refer to the commonalities across lowercase new literacies. Importantly, they describe eight central principles of uppercase New Literacies theory that capture current, common patterns (Leu et al., 2013, p. 1158). We summarize these to include:

1. The Internet is this generation’s most important and widely used technology for literacy and learning within our global community.
2. People need new practices to be able to understand and use the texts and tools associated with the internet.
3. New literacies are deictic, meaning that meaning-making with each new literacy is dependent upon the context in which a given technology is used.
4. New literacies are multiple, multimodal, and multifaceted, making them more complex in some ways compared to traditional literacies.
5. Critical literacies are central to new literacies practices.
6. New forms of knowledge, and new kinds of literacy strategies, are needed when using new literacies.
7. New Literacies require new social practices.
8. Teachers’ roles are somewhat different, in new literacies learning contexts.

Characteristics of an internet environment: affordances and constraints

Leu et al. (2013) argue that the internet is the “defining technology” of our time (p. 1158). Today, the internet plays a central role in our personal and working lives throughout our lifespans, from the time we are very young children to when we are the oldest of adults (Anderson, 2019; Rideout and Robb, 2019, 2020). The internet and other digital technologies have changed the ways we engage with literacy practices because new technologies offer different *affordances* and *constraints*, for both theory and practice. Such affordances and constraints have implications for the ways we teach students to take up different literacy practices.

Here, we use the term, *affordance*, to refer to a possibility for action posed by objects in the world; similarly, we use the term, *constraint*, to refer to a limitation for action (Gibson, 1977; Hammond, 2010; Ryder and Wilson, 1996). An *affordance* extends our capabilities as human beings, and a *constraint* restricts such capabilities. In this sense, technologies such as the internet offer numerous affordances. We also can view features, or characteristics, of the internet as affordances which themselves transform our capabilities in specific ways. Yet, affordances offered by one technology might also carry certain constraints. Such affordances and constraints have led to changes in our literacy practices and, as we argue here and elsewhere, in our social values as a result (Forzani et al., 2020).

Each new technology has different characteristics that introduce both affordances and constraints; thus, as new technologies emerge, our literacy practices change as we work to leverage available affordances. Here, we describe four central characteristics

of the internet as a literacy space, particularly as compared to more traditional, offline paper-based literacies. In so doing, we also discuss the affordances and constraints that arise from each characteristic. These characteristics include: 1) constancy of change; 2) assumption of multiliteracies; 3) easier, cheaper, and faster information access; and 4) fluidity across meaning-making environments.

Characteristic 1: constancy of change

One important characteristic of the internet is the constancy of change inherent in this literacy space (Leu et al., 2013). As new needs arise in our environments, we can address them with new tools. Digital technologies, and especially the internet, allow us to do this quickly and in real time. As a result, the focus in learning and work contexts shifts from learning particular skills or technologies to learning how to flexibly adapt to new technologies.

This constancy of change, however, creates an important constraint for theory. As Leu et al. (2013) point out, change poses a problem to the theorizing of new literacies, as it is hard to develop theory, which is relatively stable across time, around something that is not stable across time. To address this issue, Leu et al. (2013) pose the dual-level theory of new literacies, described above, that takes into account this constancy of change as one element that is stable across time. Such a dual-level theory allows us to consider what might be stable or common across time and across different lowercase new literacies while also being flexible enough to accommodate change as new literacies emerge.

Characteristic 2. Assumption of multiliteracies and online mobility, creation, and networking

Another fundamental characteristic of an internet environment is that multiliteracies are the norm rather than the exception. The term, multiliteracies, in this context refers to the full range of ways to share and create meaning across different cultural, social, or domain-specific contexts. These forms of meaning-making are more flexible and multimodal than paper-based environments, where it is harder to use multiple modes, texts, and activities, and with multiple people, at the same time. Digital environments, however, are conducive to multiliteracies in the broadest sense. In reflecting on multiliteracies, we draw on the New London Group (1996), Kress (2003, Chapter 4), and Coiro (2020) when referring to multiple modes, text types, number of texts, activities, environments, contexts, and people. Digital technologies make it easier and faster to use multiple modes of communication (e.g., linguistic, visual, aural, spatial, gestural) at once. Additionally, different people around the world are able to make meaning across modes and contexts giving broader access to meaning-making practices to a greater number of people. Such multimodal affordances have also resulted in an important focus on semiotics rather than on reading and writing per se (Kress, 2003, Chapter 4). In a narrow sense, the terms “reading” and “writing” might refer to interpretation and creation that occurs with linguistic text. However, given that different modes use different forms of text (visual, aural, spatial, gestural as well), the terms “reading” and “writing” are no longer sufficient. Therefore, here, we use the terms “interpretation” and “creation” to capture the meaning-making processes that occur across different modes and when multiliteracies are centered (Forzani and Ly, 2022).

One of the affordances of multiliteracies is that there are more access points and meaning-making opportunities for more people across potentially common modal lines. For example, visual symbols and video can be interpreted by nearly anyone across the globe, making it easier for people who might not share the same language to communicate. Although visual signs and symbols are culturally situated and might be interpreted differently by people from different cultural communities, they are also more readily available and interpretable than alphabetic or other linguistic signs.

Another affordance of such multiliteracies is the integration of both interpretation and creation processes. Rather than each of these two categories of practices occurring at separate times and in separate activities, in digital environments, these practices typically occur in tightly integrated iterations, and throughout the same activity.

Beyond affordances, one of the constraints of multiliteracies is the greater complexity of information and of the literacy practices one needs to use in order to make meaning from such information. Because there are now more texts, text types, and modes, the possibilities for different combinations, and the number of aspects within each activity, are greater, resulting in a potentially more complex meaning-making experience (Coiro, 2020). Despite this, however, multiliteracies also can offer support, since there are different possible ways into a text and into meaning-making for any given person.

Characteristic 3: easier, cheaper, and faster access to information

A third characteristic of the internet and of other digital environments is easier, cheaper, and faster information access. Today, 93% of Americans report that they use the internet (Perrin and Atske, 2021); worldwide, more than half of the global population is digitally connected (Johnson, 2021). People around the world can now access an immense amount of information at any time and place with the relatively fixed cost of an internet connection and a device with which to access it. In contrast to the cost of books and other paper materials that provide information, the internet is relatively easy to access, cheap, and fast. People do not need to spend time locating stores or libraries that have finite materials available and do not need to constantly purchase new materials as people want them or as they become available. Rather, people can, without leaving their homes, and in a matter of minutes, identify and locate needed information using a search engine.

One affordance of easy access is expanded, but sometimes problematic, participation and collaboration. Easier access could mean that more people can participate online. Yet, there are still people who do not have high-quality, fast, and affordable internet access. When access to online information is shared across different countries and cultures, the result could lead to greater global and multilingual interconnectedness. Particularly important is the notion that those who might not have been able to participate in certain spaces in the past, because they did not have access to them, may now have greater opportunity to access such spaces digitally. Although digital spaces often reflect societal structures, people may have greater opportunity to participate in online spaces that anyone can access.

One constraint of increased information access is the need for greater criticality. Because anyone may publish whatever they wish online, with few restrictions and vetting processes in place, there is a high degree of diversity of text types and quality on the internet (Britt and Gabrys, 2001; Rouet et al., 2011). Such information diversity can make it challenging for readers to make sense of texts and to determine who and what to believe. Thus, online contexts require readers to forefront critical reading, making the information vetting process largely the responsibility of individuals rather than of institutions.

Characteristic 4: fluidity across meaning-making environments

A fourth characteristic of digital spaces such as the internet is the ability to fluidly move in and out of participation contexts as one negotiates identities across in-person and digital environments. One example of this is the ability to use different modes of communication and the affordance of technology tools to quickly change text from one mode to another (e.g., the “talk to text” feature on a phone that allows a person to use the microphone to compose an email or text message, which then gets translated from aural to linguistic mode). Although the email gets composed by the user in one mode (aural), it gets sent to another user in a different mode (linguistic). A similar process might occur across environments. A user might have an experience in an in-person context and then move to the internet, just as when collaborators have a meeting in-person and then send a follow-up email. In our day-to-day lives, we often move across paper and digital environments in seamless ways.

Such fluidity of modes and environments has implications for learning contexts and for identity and digital presence (e.g., for how we position ourselves and our identities online; see Semington et al., 2017). Students, teachers, and learners of all ages are challenged to consider their identities across in-person and digital environments and to consider the extent to which such embodied identities align (or not).

Shifting social values and opportunities for social change

Digital affordances on the internet have both enabled and demanded a shift in what we position here and elsewhere (see Forzani et al., 2020; Leu et al., 2013) as social values. In particular, we outline four social values of the 21st century that have emerged from the rise of the internet, and particularly since the rise of Web 2.0 in or around the year 2000 (Greenhow et al., 2009).

Four 21st century social values

Participation & collaboration

The internet has enabled more people to both access and produce information. As a result, a greater number of people, across geographic, economic, and other divides, have been able to participate in society through the use of the internet (Jenkins, 2006). Not only can people access information through the internet, but they also can participate in a host of local and global social networks, such as Facebook, Instagram, and TikTok. Participation in organizations and other groups often involves some kind of connection through the internet. Moreover, people can communicate and collaborate across social divides. Although this does not always occur, and many internet contexts mirror existing social structures in the physical world, people also have opportunities to participate in ways that they might not otherwise have had when face-to-face.

Undergirding a focus on participatory cultures is a move toward embracing a global understanding of the world, including an openness to diverse cultures, perspectives, and ways of knowing, doing, and being. In order to communicate and collaborate across different cultures, languages, and perspectives in productive ways, people need to be open and willing to listen and understand other ways of thinking and communicating. Particularly with growing concerns about increasing social and political polarization, spurred by the rise of digital media (Dvir-Gvirman et al., 2016; Van Aelst et al., 2017), the ability to intentionally seek out multiple perspectives and to work toward solutions to problems that will work for multiple different stakeholders becomes an important skill.

Criticality, responsibility, and social change

Digital participation has demanded a focus on criticality. Here, we use the term criticality to refer to a spectrum of perspectives and practices that involve questioning and judging information and social structures and taking action toward social change (see, for example, Garcia et al., 2020). On one end of the spectrum, a person might simply question information rather than accept it as true without examining it first. Such questioning, however, can lead to judging information, which can lead, at the far end of the spectrum, to taking action toward changing existing realities and social structures.

Because anyone can publish whatever they wish on the internet, there are few vetting processes. This means that people have to evaluate information for themselves, determining the extent to which information is relevant and credible for their purposes. In the past, institutional vetting processes, such as those undertaken by publishers, libraries, and even book stores, have resulted in less diversity of text types and text quality, particularly for those texts most widely available. Today, however, it is largely up to individuals to vet information for themselves. Additionally, because of the affordances of multiple modes and texts in digital environments like the internet, people also have to understand, scrutinize and evaluate the ways in which different text types and text features affect information quality. With the rise of the internet, and, especially, of Web 2.0, criticality has become a central way of approaching and engaging with the world (Leu et al., 2013).

In addition to the need for criticality, the internet also has enabled people to critique social structures and to take action to change those social structures. The internet allows for access to information as well as for the formation of social groups—often across economic, geographic, and global boundaries that would not have been possible without the internet. Our ability to network in an unfettered manner allows us to take action to change power dynamics.

People have a responsibility to create and use information in critical, ethical ways. Because it is incredibly easy to create and share information rapidly, people have the responsibility to check credibility, interpret potential bias, and to consider, for themselves, the impact on other individuals and communities before doing so.

Multiplicity, hybridity, and flexibility

Because digital technologies allow for more modes, texts, text types, and even activities, our social values have shifted from embracing single to multiple forms of text and communication. With this shift comes a focus on hybridity, or working and moving within different combinations of modes, texts, practices, and communities, and sometimes in novel ways. Along with the need to be able to understand and make meaning from and with multiple modes and text forms across multiple, diverse cultures and people comes the need for flexibility. Such flexibility means that people need to be able to not only move among different modes, texts, and cultures but also must be able to be open to all of these different possible combinations. Additionally, people have to become flexible at moving across contexts—for example, beginning an activity in an in-person environment and moving to a digital environment. Similarly, rather than being focused in particular disciplines or fields, people are often working collaboratively in groups to solve interdisciplinary problems.

Creativity, innovation, and problem-solving

As the internet has allowed for information to be produced and copied quickly, a focus on creativity and innovation has arisen. Because the internet and other digital technologies allow for the rapid distribution of information, and because they now allow for text to be created through AI technologies, those who have new ideas and texts bring added value that cannot be created by AI (see, for example, Hancock et al., 2020). Therefore, our society places value on innovative and creative ideas that cannot simply be developed or reproduced by technology.

Moreover, rather than simply memorizing information, we now value accessing and using information in the service of problem-solving (Jacobs and Castek, 2018, 2022). Often, this means approaching informational problems with an inquiry framework—and being open to multiple, possible solutions—rather than approaching problems as if there is one, right solution. In an information-based society, people need to be able to locate, organize, evaluate, synthesize, and communicate information in creative and innovative ways as they work toward solutions (Leu et al., 2013).

New literacies social values reflected in educational standards around the world

Educational standards are beginning to reflect these changes in social values. Large curricular frameworks, such as the International Society for Technology in Education (ISTE, 2018), Partnership for 21st Century Learning (Battelle for Kids, 2019), NCTE's Position Statement on Adolescent Literacy (NCTE, 2018), and the Common Core State Standards (National Governors Association Center for Best Practices, Council of Chief State School Officers, 2010), now include practices that reflect such social values. In schools, course work centers on activities that support the development of such practices and values. Rather than being focused on individual work that occurs in isolated disciplinary areas, these new standards focus on developing students' capacity for collaboration, critical thinking, digital citizenship, innovation, and the ability to work together to solve complex, interdisciplinary problems such as those we are faced with in the real world. In this way, the affordances and constraints of digital literacies and the internet have shifted the kinds of practices we teach in schools and the ways in which these practices get taken up in learning and instruction as educators aim to support students to be prepared to work in a digital world.

Under-realized potentials

Criticality and justice

One of the most important under-realized potentials in the digital literacies field is a focus on criticality and justice (O'Byrne, 2019). Because the internet enables more people to access, interpret, use, and create information, more people—across diverse cultural, social, and economic divides—now have the ability to critique and evaluate the world. Such critique and evaluation often leads to action. Once people identify problems with existing ways of thinking, living, doing, and being, they often want to act to address

those problems. Moreover, the internet enables social action in important ways, since it allows people to gather together across more traditional divides, finding strength in numbers. The internet also allows people to take action across existing social structures, since people with an internet connection can easily send email, share information, make and carry out specific plans by communicating on social networks, websites, and through private networks.

Despite the ways the internet facilitates social change, teachers need to take up the call to become a change agent. By virtue of their role within communities, many educators have opportunities to engage in democratic discourse that the internet helps facilitate, such as engaging in debates and advocating for more equitable global solutions (Bourn, 2016). Although some classrooms have begun to incorporate projects that address social change, many have not. In fact, such social change is not often written into curricular frameworks. On the contrary, social change is sometimes seen by those in power (and those who create curriculums) as something to be kept out of our schools.

Self-criticality

Another important under-realized potential is the need to be self-critical of our own digital literacies practices. As it becomes easier and easier to quickly share and reproduce information, we have to consider the extent to which we are sharing reliable information and the impact that the information might have on other people. For example, before sharing information, we might ask ourselves how the information might affect communities of people other than those of which we are a part. This is especially relevant in a global society in which we have greater opportunity to interact with many different communities and people through different internet contexts.

Additionally, while the internet widens the communities of people with whom we interact, it also can narrow available choices. The algorithms of many social networking sites, such as TikTok and Facebook, are actually designed to limit, in scope, the kinds of content we see. Moreover, because individuals decide to whom to be connected in social networking platforms, people often are connected to other people that are similar to them. This means that the content we see is more likely to be narrowly defined because we are exposed to fewer outside perspectives. Such a phenomenon is sometimes referred to as being inside a digital echo chamber (see Dubois and Blank, 2018). Thus, rather than having to interact with people less like us in our in-person lives, we can choose to interact only with those who share perspectives similar to our own.

However, on the internet, people also have unprecedented access to multiple different kinds of information and perspectives and can choose the media and information that they read and believe. Recent research suggests that people with diverse media interaction can avoid digital echo chambers within a high-choice environment such as the internet, if they choose to do so (see, for example, Dubois and Blank, 2018).

Researchers and practitioners across the education sector are called to move toward more expansive and deeper acts of social justice in order to affect social change. As educators, we must intentionally make efforts to seek out diverse media and information and to critique—and to thoughtfully engage in—our own digital literacies practices. Because the default in online spaces is often for us to be exposed only to perspectives similar to our own, intentional effort is required for us to seek out, and to be open to, ideas other than the ones we already hold. Creating purposeful practices and habits of mind for learners of all ages to do this then becomes important in our digital society, especially for the purpose of achieving digital equity and digital inclusion.

Digital equity

Digital equity is a condition to strive for; yet, according to Reder's (2015) analyses, there is a consistent lack of digital equity based on race, gender, and national origin. The education field cannot ignore these vast racial inequities. Although education is seen by many as a pathway toward personal achievement and transformation, it is not a level playing field for all (Jacobs et al., 2022). Equitable educational practices must be rooted in a commitment to understand and build on the skills, practices, values, and brilliance of the very communities that have long been marginalized (Ladson-Billings and Tate, 1995). Equity processes require that educators be simultaneously conscientious of social realities and inequities while creating opportunities for systemic change. Equitable processes provide opportunities for quality learning experiences in a multiplicity of settings in ways that position learners as knowledgeable and creative people who work in service of each other (Oguilve et al., 2021). It is only when learners have access to learning new literacies, and opportunities to apply them in flexible ways, that individuals can be fully digitally included. Together, we can strive to connect with learners and communities with the explicit goal of disrupting oppressive power structures, flattening dynamics, and leveling the playing field in teaching, learning, leadership and research. Flattening hierarchies requires educators to re-distribute authority in education (Castek and Manderino, 2020). These changes require long-term and consciously collaborative efforts.

Awareness of data practices

The Internet offers access to large amounts of data and information. As individuals engage in online experiences, the Internet is extracting large amounts of data from us. Our data is being used to influence our everyday decision-making and by corporations who make marketing decisions about our preferences. With the amount of personal data about our choices collected with every click on any website, and with wearables collecting data on where we go, and how much we move, we need greater efforts to understand data privacy and to learn data literacies. Sternkopf and Mueller (2018) suggest that learning about data is a continuous

journey that creates the ability to identify, understand, interpret, create, communicate, and compute pieces of information (data) to develop one's knowledge and ability to participate fully in society. From a more critical standpoint, educators must carefully examine the power relationships that exist between those who produce the data, those who control the data, and those who use the data to produce the narratives that shape the social, cultural, and political world to influence economic decisions. The power to collect and interpret data can be seen as a process (Bloome et al., 2005), revealing how data can be used to either persuade, coerce, or bias a particular point of view.

In order to foster critical data literacies, we advocate for engaging learners in conversations that question who gets counted and who is not represented in data (Sheldon & Castek, accepted). As educators, we need to examine the critical and social practices to make sense of experiences in the digital world of data. This includes how we individually and collaboratively engage in creative thinking and critical questioning to learn, problem-solve, and examine the power relationships that exist between those who produce data, those who control data, and those who use the data to influence decision making.

Interconnectedness of literacies online

Digital literacies are complex, multiple, and diverse (Coiro, 2020). Heitin (2016) suggested that there are three dimensions to digital literacies: (a) searching and locating digital content (e.g., Leu et al., 2013), (b) creating digital content (e.g., Hobbs, 2017), and (c) communicating or sharing digital content (e.g., Spiers and Bartlett, 2012). Digital content refers to any product and/or information in a digital form. Within these digital forms, digital literacies, reading, writing, viewing, content creation, and communication can be viewed as tightly intertwined. As we search for and locate information, for example, we might also be creating new digital content and sharing the content that we find, along with the newly created content that resulted. In this way, meaning-making processes integrate seamlessly, within a single task, across all three of Heitin's (2016) dimensions of digital literacies. Now and in the future, digital literacies process are likely to become even more interdependent as more digital texts, tools, and networks emerge and the digital landscape continually changes.

A call to action — looking toward the future

Avenues for research

Based on the under-realized potentials we identified, we outline two key areas for future research: (a) research on critical digital literacies (see, for example, Pangrazio and Selwyn, 2019)—especially those studies that focus on social change (see, for example, Garcia et al., 2020)—and (b) research on digital identity and citizenship (see, for example, Choi et al., 2018; Gleason and von Gillern, 2018; Lauricella et al., 2020). Importantly, these two research areas are synergistic in that both support a more globalized, democratized, and equitable society in which people are both open and critical to their own and others' perspectives. This is a departure from some past social realities in which it has been productive, and sometimes even beneficial, for people to be closed to perspectives other than their own. In our pre-internet society, most communities interacted mainly with others within their own locality and only very little with other communities. In such contexts, the need to understand multiple and diverse perspectives was less important. However, in a globalized society, this need is paramount. Thus, future research requires us to work toward supporting learners to negotiate meaning across multiple perspectives, and especially across perspectives that differ from their own.

Research centered on criticality and social change

Research in digital literacies needs to take up issues of social justice and social change. The field of critical media literacy has begun to do this, examining the ways youth interact with media and the ways they critically interpret and construct media to purposefully resist existing, oppressive social narratives (Graves et al., 2020). Such research has begun to work toward effecting social change from the ground up by engaging youth in critical media literacy instruction focused on taking action toward social change using media platforms (see, for example, Guldin et al., 2021). In particular, those who study online reading and information evaluation need to consider the ways in which power structures in society affect students' online reading practices, and the ways in which students can use online reading and research to investigate, and work to change, social issues since the internet is an environment highly conducive to this work.

However, more research is needed to better understand how to support learners to engage with information and perspectives that differ from their own. In particular, we need to better understand how to support learners to be open to, but critical of, both their own and others' perspectives. Some research has begun to examine how readers' own identities and prior stances on issues, as well as their epistemic beliefs, or beliefs about how knowledge is constructed (see Kuhn and Weinstock, 2002), affect the ways in which they approach newly encountered perspectives and information. For example, Kiili et al. (2018a,b) found that students' prior stance on an issue affected their ability to evaluate online information. Cho, Woodward, Li, and Barlow (2017) found that online readers with more, compared to less, critical and flexible stances toward knowledge learned more from reading and were better able to generate questions after reading.

Importantly, future research that supports learners to be critical of their own and others' perspectives will require researchers to draw on not just educational research but also on research in the social sciences, which has begun to examine the psychology behind people's practices in digital literacies environments, such as how one's identities and beliefs affect perceptions of information such as those encountered in social media environments (see, for example, [Pereira et al., 2021](#)). Such studies allow us to better understand how to support learners to be critical of their own and others' ideas so that we can work toward social change across differing perspectives.

Research centered on digital identity and citizenship

Relatedly, many curricular frameworks around the world such as the International Society for Technology in Education ([ISTE, 2018](#)), Partnership for 21st Century Learning ([Battelle for Kids, 2019](#)), and the Common Core State Standards ([National Governors Association Center for Best Practices, Council of Chief State School Officers, 2010](#)), now include digital identity and citizenship standards. For example, the ISTE digital citizenship standard focuses on supporting students to practice safe, ethical, and responsible information use.

In a post-truth era, responsible information use includes carefully evaluating the credibility of the information found on the internet rather than assuming it to be true. Learners must therefore thoughtfully consider their own and others' identities as they are engaging with multiple perspectives around the world. Work is emerging in understanding how students and teachers construct their digital identities and how they negotiate their identities within and across face-to-face and digital environments (see, for example, [O'Byrne and Hunter-Doniger, 2021](#)), but more work is needed in this area.

Practical considerations in our lives and in everyday contexts

The American Library Association suggests that digital literacy is the ability to use information and communication technologies to find, evaluate, create, and communicate information ([Digital Literacy Task Force, American Library Association, 2012](#)). In this chapter, we use the term literacies in the plural as a way to recognize that digital literacies refers to a composite set of skills, mindsets, and social practices that are needed to navigate online in everyday contexts and to use novel resources, tools, and interfaces in efficient and flexible ways. Literacies in our digital world are continually changing and are part of the constellation of literacy practices necessary for civic, economic, and personal engagement in all facets of our lives. We advocate for literacy educators to embrace a broader view of literacies that are neither digital nor paper-based but instead are flexible, reciprocal, and recursive across online and offline spaces. In the process, educational institutions need to expand the role of digital technologies in school, outside of school, and in our world at large and work in concert with educational partners locally, nationally, and globally linking the work of teachers, administrators, school personnel, families, and global communities.

Teaching and learning

Literacy practices are pluralistic and comprise more than reading, writing, listening, and speaking processes that have historically been core parts of educational spaces. Likewise, knowledge is not acquired through a linear process ([Kot, 2011](#)). Instead, learning is fluid and dynamic, flowing through a network of individuals, communities, societies, technologies, and artifacts ([Goldie, 2016](#)). [Watulak et al. \(2018\)](#) consider the interconnection of knowledge, people, information sources, technologies, and communities. Through this lens, literacies are mobile and evolve across spaces, times, modes, disciplines, media, and contexts ([Stornaiuolo et al., 2017](#)).

Literacies will inevitably shift over time as technologies rapidly emerge today, tomorrow, and into the future. Implications of constant change have profoundly impacted the learning materials we design, instructional pedagogies we employ, and the learning environments that transverse online and offline learning spaces. To help learners become fully literate, educators need to create multiple opportunities to integrate digital literacies, multimodal approaches, texts and tools for design, creation, play, and problem-solving across the curriculum both in and out of school. For example, co.lab is a freshman program in the Leyden School District. <https://sites.google.com/leyden212.org/colab/co-lab>. Their interdisciplinary approach to learning and collaborative teaching spaces foster inquiry, leadership, communication, and reflection. Their integrated approach to curriculum design connects all the disciplines and supports learners' digital literacies as they discover the passions that fuel their learning. Unit themes include identity, adversity and resilience, empathy, and global contributions, which are woven throughout project-based instructional approaches that culminate in community engagement events. Learners design advocacy campaigns, publish models and displays, create films, and illustrate learning through multimedia learning products that advance their self, school, and/or communities. What is salient in the co.lab context is the emphasis on ways critical literacies create opportunities to conduct inquiry and encourage the sharing of ideas digitally beyond traditional, paper-based forms. Such efforts illustrate the possibility of enacting robust efforts to incorporate digital literacies instruction widely to expand ways of reading, learning, collaborating, networking and sharing knowledge. More illustrative examples are needed to envision expansive and dynamic new literacies educational transformation. Expansive conceptions of new literacies practices widen our views of digital and multimodal learning, expanding the ways in which we conceive of meaning-making, both now and into the future.

Introduction & context

A strong body of critical scholarship has been accumulating in developed nations over the past decades supporting film and media education as core components of formal school curricula from the primary years through to students' early-to-mid teens (Buckingham, 2003; Hoechsmann and Poyntz, 2012; Cannon, 2018). In many instances, however, this scholarship fails to translate into policy and practice. In England for example, the country in which accounts of practice in this chapter are located, a narrow back-to-basics agenda prevails in state education that ignores media learning. Watching, analyzing and producing media texts are often framed as introductory routes to literacy work perceived as legitimate. Either this, or engagements with film, moving image and animation remain in the world of informal literacy enrichment, once the "real work" of established literacy has been covered.

This view of media literacy as a secondary or "residual" category (Potter, 2012) contrasts with other nations' progressive curricular reforms that incorporate everyday digital media cultures and media literacy programs as vital components of a more relevant and dynamic curriculum (Kupiainen, 2013). It seems that, if media literacy practices are accommodated at all in the English state school system, they are accommodated mainly in the informal spaces of extracurricular learning. While these peripheral approaches are welcomed, they are by no means enough nor sufficiently widespread to equip children and young people for adequate media learning in the digital age. This chapter reflects on the importance and relevance of critical and creative media education across the curriculum from the primary years of learning onwards. Digital media production processes and creative media arts are seen as central dimensions of a wider and more diverse conceptualization of literacy, one that is in step with multiple communicative modes, digital meaning-making practices and the complex moving image and media landscapes in which most children and young people in developed countries are immersed.

The rationale for a multimodal approach to literacy (Jewitt, 2008) is based on the premise that there is a need to equip our youth, not only with digital skills and knowledge narrowly linked to employability, but also with a critical grasp of the communicative means with which they make sense of themselves and others, and the mediated sociocultural circumstances in which they live their lives. To conceive of literacy as a set of static reading, writing and literary appreciation skills, is simply not enough for full and meaningful participation in late-modern society. Following Gee (2015) and the tradition of New Literacy Studies (NLS), and Street's social literacies work (2003), this chapter advocates for school experiences that are responsive to the contingencies of everyday living and being. These are literacy practices conceived as fluid, embodied and dynamic (Potter and McDougall, 2017), and have more to do with the relational and the sociomaterial conditions of learning (Burnett and Merchant, 2020a,b; Hawley, 2021; Parry and Taylor, 2021). In this view, pedagogies shift to less hierarchical and more inclusive models of practice, and where collaborative practices in so-called "third spaces" come to the fore (Potter and McDougall, 2017). Of primary importance in these spaces is an approach to literacy that builds on learners' existing interests, knowledge and cultural affiliations, thus a critical embrace of youth media worlds and popular culture is as important as the introduction of a range of canonical texts.

The author argues that as the noise of "educational technology solutionism" proliferates (Selwyn, 2016), and as the use of commercial digital platforms consolidates in school contexts (Williamson and Hogan, 2020), there is a need to press pause on issues of efficient data management, to give more thought to the relevance of school curricula to learners' lived lives. Many schools are sold all-encompassing "ed-tech solutions" by technology companies promising to improve schools' and pupils' "performance". It is as if what matters most is the mobilization of one-size-fits-all "what works" ideologies (Macgilchrist et al., 2021), with contestable ends that expunge the complex heterogeneity of school contexts and mask the uneven distribution of basic educational resources. The global pandemic has brought to light many of the pre-existing inequalities that permeate school structures, not least on questions of digital access. This is the moment for remote learning for all to be improved, and for learners of all ages to be authorized to look both inwards for reflection on their media habits and cultural agency, and outwards toward an analysis of the invisible

ideologies that give structure to their media worlds and that shape their very identities (Buckingham, 2008, 2019). The proposition is that as children and young people make, edit and disseminate film and moving image texts of relevance to them, they engage in a level of praxis that develops a particular disposition generative of positive and lasting learning moments. This blend of reflexive engagement with production, and then the sharing of creative outputs is framed as a kind of alchemy.

The reader will be presented with three case studies, involving children ranging in age from 10 to 15-years-old in informal school contexts. The first involves film-making in an international film education program based in Paris, the second relates to a school drama and digital animation project in London, and the third describes a dramatic, multimodal promenade performance from the *Beowulf Sydney Project* in Australia (Cameron et al., 2018). These arts-based approaches to literacy (Burn et al., 2014) foster pupils' feelings of empowerment, performance and artful manipulation of multiple forms of media. It is argued here that these practices not only build confidence in the ability to learn, but esthetic sensitivities toward the moving image, soundscapes, prop-making, puppetry, the senses, and the smooth orchestration of time and space. Less is written about the latter modes that shape the temporal and the spatial, preoccupied as many are, and understandably so, with the meaning-making affordances of the audiovisual (Bazalgette, 2000). Young participants in these projects engage in productive, playful and reflexive practices that explicitly question creative choices, and in the mobilization of rhetorical devices to produce particular effects (Burn and Durran, 2007; Cannon et al., 2018). Experiences such as these arguably function as stepping stones to children's incipient critical understanding of the constructed nature of their media worlds. Crucially, and by extension, sustained practical media work of this nature may start to have a bearing on the dispositions that inform their capacity to have a stake in these worlds.

A snapshot of media education in the UK

Media education in England is in a parlous state. The other UK nations—Wales, Northern Ireland and Scotland—have more advanced ideas on what constitutes a broad curriculum inclusive of digital media and the expressive arts up to 14 years of age. Twenty years ago, UK government interest in creative media arts was very much in evidence, and direct funding for projects was made available over the course of a decade (Parker, 2013). Cultural partnerships, and research therein, flourished between schools, artists, practitioners and arts agencies (Thomson et al., 2012). However, more conservative policy-makers have since failed to build on these developments, and as Buckingham (2014) critiques, even actively sought to remove any mention of digital media from the curriculum in England. Concurrently, as a result of strong industry lobbying, the subjects of computer-programming and computational thinking were hastily created and rolled out to primary schools across the country in an effort to fill workforce gaps. Such instrumental interventions were regarded as an evolution of the ICT curriculum (Information, Communication and Technology), but also oversaw the loss of the Communication component. Media literacy educators saw the demise of creative media arts initiatives as a missed opportunity for progressive education to gain a foothold in the transformation of established literacy practices.

It will be clear from what has been detailed above that literacy is an ideological and political football and the powers that mold its contours and content are the same powers that constrain the possibilities for learners to represent and express themselves using a variety of different symbolic resources. In the move from page to screen, this chapter asserts that the written word is just one of a range of media, and the pen just one of a range of tools, with which to wield meaning and participate socially and culturally. Indeed, arguments have been made based on the articles of the UNCRC (United Nations Convention on the Rights of the Child, 1989), that it is children and young people's right to be offered as rich a palette as possible of digital tools, languages and representational practices to express their identity (Cannon et al., 2022; Cannon, 2023). Such an approach is regarded as more egalitarian and accessible for diverse and democratic communities of learning. The reader will detect a strong socio-political dimension to the ideas on literacy presented in this chapter, and the instrumental ways in which it can be re-fashioned and mobilized in the interests of the state, without necessarily appropriate thought being given to the varied needs and interests of young learners. It is with this imbalance in mind that I turn to theory to bolster the case for a wider literacy and the development of learners as media literate practitioners.

The critical and the creative: an alchemy of practice

The theoretical framing of this account is rooted in two academic disciplines, the one being Cultural Studies (Hall, 1997; du Gay et al., 2003), the other New Literacy Studies (Street, 2003; Gee, 2015). The scope of this piece of writing does not allow an in-depth foray into these disciplines, but by way of summary, I offer these working definitions for the purposes of grounding the accounts of practice to follow. In the Cultural Studies tradition, attention is given to the ways in which texts and artifacts are produced, circulated and consumed within a matrix of power relations. These social dynamics and the multiple ways meanings are constructed, foreground the analysis of discourse, texts and historical context. As we enter the second decade of the 21st century, digital media are the primary means of communication and everyday cultural exchange, thus, a vision of literacy as related to productive practices and the situatedness of social interactions becomes more salient.

We can start to see the connections between the principles of Cultural Studies and New Literacy Studies: they are concerned with an impulse to continually experiment and question, and to create and collaborate on new knowledge and perspectives. Critical social thought and creative identity work (Potter, 2012) are less privileged in institutional literacy practices, whereas these two pillars of social progress are what binds the two academic traditions on which this account draws. It is proposed here that film

and moving image education is one means through which a contextualized sense of self can be explored, embodied and discussed (Cannon et al., 2014). The act of producing and displaying moving image texts with a soundtrack is suggestive of a process of alchemy (or “une petite alchimie” as described by Natalie Bourgeois, in Cannon, 2018, p. 180), where the relationship between children and their films shifts. In theoretical terms, an “(im)material” (Burnett et al., 2012) set of localized meanings conceived in a private space, translates into diffuse meanings in a communal space, and the ability to sense and articulate this transmutation, is a powerful learning moment.

Le Cinéma: Cent Ans de Jeunesse

Film literacy is a discrete discipline but for the purposes of this chapter, it is framed here as a subset of media literacy, as it addresses the ways in which our cultural repertoires, whatever the origin, become valued resources to be brought to light, and then critically and creatively re-worked through the medium of film. I first introduce an international film education program—Le Cinéma: Cent Ans de Jeunesse (*Cinema: a hundred years “young”*, henceforth CCAJ) based at the Cinémathèque française in Paris, and its collaboration with The British Film Institute (BFI) in London. The program has been running for over 25 years and the BFI has developed its own national version of the program. In this account, I describe workshops and events with 10–11-year-old pupils at a north London primary school, a more detailed description of CCAJ’s practices on an international scale, can be found in Reid (2019).

The overall purpose of CCAJ is for young people and educators to watch, interpret, discuss and practice making films, where film is conceived as an art form with intrinsic worth, as opposed to a medium with strictly entertainment or instrumental value. Participants are given a series of simple and highly structured production exercises, culminating in a “film essai”—which is an 8 min short film exploring the theme for that year. The program has other distinguishing features: themes revolve around film language; there is no appeal to the tropes of Hollywood glitz, festivals or competition; the age range of participants is from 7 to 18; and where possible some of the young film-makers from around the world unite in Paris for summer screenings of their work. A key component of the program is the focus on the esthetic affordances of film as an art form. Other familiar dimensions of educational filmmaking, such as acting, narrative structure, script-writing and dialog are de-emphasized in favor of visual and cinematic storytelling. But perhaps the most important characteristic is the invitation to film-makers of all ages to discuss their authorial choices after the screening, in a public multilingual Q & A. Amid a group of peers, young creators are given opportunities to articulate their craft explicitly, to express the challenges they faced in the production process, and to exercise their critical muscle in a safe receptive arena.

CCAJ actively works at maintaining the balance between theory and practice, and between reflection and material experimentation. This key principle means that explicit attention is given to the reading and writing of film. Past themes on cinematic grammar have included: camera movement, color, light, depth of field, mise-en-scène, the weather, games and playing, or the more conceptual hiding and revealing in film. In 2013–2014 for example, the theme was “le plan-séquence”, or the long take. This is defined as one sustained shot, moving or static, that frames a sequence of events, and was inspired by the century old practices of French film pioneers, the Lumière brothers. Indeed, continuities with cultural histories are maintained by watching specific clips from a wide range of nations and times past, with viewer-learners’ sensibilities attuned to one particular film esthetic. Natural elements in the local environment, tropes from popular cultural texts, and qualities within the cinematic frame are in constant dialog with each other, combining to develop the digital artistry of students.

My account in this volume focuses on orientation to learning that illustrates the kinds of sophisticated cognitive and imaginative thought processes analogous with regular literacy practices.

Learners are offered opportunities to voice creative decision-making, on the basis that confident speaking drawing on collective experience, is a vital aptitude that is often over-looked in conventional literacy practices. Film screenings are integral to the design of CCDJ, in that they are a moment of celebration, a part of the media-making process during which audiences become co-collaborators in the film’s biography. Burn (2009) proposes that the making and showing of film and media texts transforms the maker in empowering ways contributing to experiences of cultural engagement that might otherwise elude them. As the young makers assemble in front of the screen, even when words evade some of the less vocal pupils, data suggests that most feel a unique sense of ownership and authorship.

More detail on the intricacies of the CCAJ program and the analysis of the children’s making experiences can be found in Chapter 5 of Cannon (2018), what I wish to demonstrate below is the significance of the post-screening Q&A. Having answered the same film brief, the audience of peers are imaginatively and cognitively engaged in each other’s work. Questions are posed and creative challenges are discussed in an open arena. In most cases, the quality of peer-to-peer attention at this point is almost palpable as the normative hierarchies are overturned and autonomous learners express themselves from a position of knowing through experience, rather than being told by those in authority. The level of sophistication in shooting and editing that it is possible for young film-makers to achieve, and for young audiences to notice, is such that intellectual curiosity is piqued and artistic detail starts to surface.

The reader may remember that the theme for the particular year in question was the long take, where students were to experiment with the nature and composition of a long take and how they can be achieved in a school environment with an iPad and no steady-cam or professional equipment. An example of nuanced understanding and creative problem-solving was evinced when one pupil explained to the attentive audience how her group enacted one of the stipulated camera movements in the brief. According to the CCAJ brief, the camera had to bifurcate, meaning that it had to depart momentarily from the main action, move autonomously through the space of the story world, and then re-join the action. The children decided to achieve this by leaving one dramatic scene in a classroom and joining another in the playground. They shot the long take through a series of doors and along corridors using

a school dinner trolley as a dolly, with the camera secured on top with tape and a small tripod. Along the way the group figured out how to open double doors and negotiate flights of stairs while filming so as to enter the playground and re-join the actors to effect a smooth transitional moment. This kind of initiative on the fly is typical of the kind of practical decision-making that filmmaking can occasion. Over a period of sustained practice, the pupils deal with constraints and amass an archive of audiovisual vocabulary to tell their stories with impact and artistry. Reid (2019) argues that to be literate is to fully participate in a culture, the language, the values, and the meaning-making and sharing practices of a community, and such dialogic screening events are one way of rehearsing these capacities.

Blending drama and digital animation

Digital animation is a mode of meaning-making that remains undeveloped in many mainstream school environments, which is lamentable when considering the ways in which it can enlarge orthodox literacy and visual arts practices from an early age. Digital animation can be slotted into classroom practices across the curriculum, whether in the context of storytelling or the illustration of scientific processes, it combines the use of film language and hands-on craft principles. The next case study demonstrates how animation can be brought into the realm of dramatic performance to enhance mood and atmosphere, while providing important additional roles for pupils in the iconic event that is the production and performance of a school play. Researchers from the UCL Institute of Education in London were interested in the relationships between drama, literacy and digitally mediated animated texts. This project, entitled *Adventures in Drama and Digital Animation*, was funded by the United Kingdom Literacy Association (UKLA), and involved a group of 10-year-old animators collaborating with practitioners from an internationally recognized theater company, called 1927.

1927's expertise in animated backdrops was central to the investigation and provided inspiration for a school production of *The Lion King*. Practitioners ran workshops on how to make articulated silhouette puppets for use in animations, deploying a lightbox, the Stop Motion app and simple editing software. The class as a whole suggested key points in the narrative where an animation would be most appropriate, such as the wilder beast stampede, a dream sequence and the fall of Mufasa, and they then set about making 2D animal puppets out of black card and thin spirals of wire. A smaller group of children were shown how to turn the puppets into animated characters in evocative narrative sequences. Each sequence was a separate movie file, and these were inserted into a Power point presentation, where the slides served as multimodal backdrops.

There were many interesting outcomes in this project, the extent of which had not been foreseen at the outset, namely: the different backstage roles that emerged as the play and peripheral activities progressed; the responsible sense of ownership and agency that was displayed by certain children perceived as disruptive; the leveling cultural recall, as all participants in this project could quote from the original Disney animation and contribute to the overall effect; and the esthetic and affective value of composing with material objects, moving images, music, drama and technology. From a teacher's perspective, what was overwhelmingly the case was the children's willingness to partake in painstakingly detailed craftwork to achieve particular visceral and emotional effects. This work proved to be an exciting gateway for learners described as low literacy achievers, to become cultural producers in their own right: they were offered another medium through which to re-interpret their funds of knowledge, and opportunities to gain mastery of particular digital technologies. If high stakes hand-written texts are the gold standard of literacy competence, these had been exchanged for hand-wrought displays of nuanced understanding through performative spectacle in a creative and educational context.

Blending promenade performance, literature and digital media

A further example of the ways in which media can knit the disciplines together is seen in a project for 11–15-year-olds that took place in Sydney, at the Australian Theater for Young People (Cameron et al., 2018) during a week-long school holiday workshop. The project was an "intermedial mashup" of drama, drawing, visual arts, ancient text, a 2 m-tall large-scale puppet, video game design, voice acting, digital and live dramatic creation processes, and a 20 min promenade performance for family, friends and Periscope streaming. The show re-animated, re-mediated and re-interpreted the classic Anglo-Saxon epic poem, *Beowulf*, as an integrated live arts extravaganza, complete with warriors, dragons, monsters, mobile bluetooth speakers, and the digital projection of a video game designed by children as the backdrop.

The *Beowulf Sydney Project's* interdisciplinary, drama-making model builds on Burn (2013) and Bryer et al.'s (2014) work on revisiting classic literary texts such as *Macbeth*, *Beowulf* and Edgar Allan Poe's *The Raven*, and understanding them in the context of film-making and video game-making. The latter scholars' rule-bending aligns with what Cameron et al. (2018, p. 113) call a bold "proto-pedagogy" that welcomes hybrid forms and complex collaborative classroom practices. It showcases young people's willingness to engage in emergent new forms of performative meaning-making, where they were able to: flip between genres and co-construct a hypermedia narrative; alternate roles on stage and share responsibility; take charge of the rules and conventions of game-design; see hitherto obscure connections between the ludic, the canonical, the representational, the real and the virtual; and finally the youth in this project relished in the real-time appreciation of the audience's response to the "liveness affect" (Cameron et al., 2018, p. 138). School shows strike a chord in most of us, often etched in memory as moments in childhood that in some way transcend the norms. In this project, the mingling of media and visual arts, literary forms, technology and the unconventional proximity

between audience and performers disrupted traditional boundaries. The disposition to experiment playfully with expressive modes is part of what constitutes critical media literacy (Cannon, 2018), rehearsing as it does the means by which a comfortable and meaningful collusion with audiences is achieved.

Concluding thoughts

It has been put forward that educational film and media production activities illustrate the kinds of situated cultural practices that encourage dynamic perspectives on literacy, but they are more than this. The momentum that was generated was a gestalt of greater significance than the media texts themselves. Pedagogies in “third spaces”, meaning those interstitial learning spaces that are neither school nor home, are permeable and allow for informal and perhaps previously unrecognized skills and abilities to emerge and be valued (Potter and McDougall, 2017). Indeed, CCAJ principles and those underpinning the drama, and mixed media performance projects are dismissive of prescribed ranking and categorizing systems; rather the aim in this work with young people is for a parity of understanding, and a co-dependence between apprentices and facilitators. In other words, project work that involves integrated arts and intermedial practices often generate a kind of wisdom that attends to the value of qualitative, esthetic and conceptual relationships, and an appetite for responsibility and risk-taking.

Grammar or spelling inaccuracies in print are a common occurrence for some learners, and this is damaging and disempowering if reading and writing are the sole means of representational story-telling at their disposal. Story-making with media enables fluency in a language that is already familiar, and any sense of failure is just part of the process of iterative review and redraft. By widening the palette of available tools and media with which to make meaning and authorizing the incorporation of popular cultural motifs in literacy work, school leaders are participating in more democratic, relevant and inclusive approaches to learning. These are safe spaces for children and young people to practice oracy and rhetorical skills, to debate ambiguous meanings, and to offer rationales for creative actions. It was suggested earlier that there is a sweet spot of learning that can be described as “une petite alchimie”, at the moment when film, media and performative texts are released into the interpretive ether and become separate entities. All the skill and open-ended possibility thinking that go into these works make a ripple in the world, and recognition of this impact emboldens the learner.

Learners get to try things out and act on hunches in intermedial territories both familiar, in terms of media consumption, and strange in terms of chances at concrete practice. Eisner (2005), in the context of art education, called this the exercise of “judgment in the absence of rule”, and for him this was one of the most important attributes of arts learning. Eisner’s thinking applies just as much in the field of contemporary media literacy, and just as much to primary learners as it does to older students. Making critical evaluations of one’s own and others’ decisions, and of the effects on others of these decisions, is an indispensable part of the quest for social transformation and human flourishing. It is incumbent on school leaders and policy-makers to refresh and reset literacy practices, in support of more sophisticated and ambitious agendas, in the interests of young learners’ participation in democratic futures.

Acknowledgment

The author would like to thank the The United Kingdom Literacy Association (UKLA) for funding the Adventures in Drama and Digital Animation project, and also to thank academic colleagues at the UCL Institute of Education, Dr. Sara Hawley, Dr. Theo Bryer and Rebecca Wilson for their expert collaboration in this project. A co-written article is forthcoming in the UKLA journal *Literacy* in 2023.

Glossary

Affordances How certain digital tools are employed to enact multimodality, collaboration/interactivity, ubiquity/authenticity, shared productivity, portability, and personalization/adaptivity in responding to and creating multimodal texts

Social semiotics Theory of how people define and interpret the social and cultural meanings of multimodal images and signs based on certain interest and ideologies

Transmediation The process of translating meaning across different sign systems to create new meanings, for example, transforming an oral narrative into a digital story through images or video

Much of literacy learning continues to privilege print literacies in ways that fail to recognize the marked shift in literacies constituted by multimodal digital practices shaping meaning-making within and outside of schools (Kress, 2010; Siegel, 2006; West, 2019). Students are increasingly responding to and creating multimodal digital texts—graphic novels, digital comics/storytelling, websites, podcasts, blog posts, videos, or digital art/music, given that adolescents average daily screen time is 7 h and 22 min (Common Sense Media, 2019). Understanding this shift entails redefining literacies based on multimodality theories that involve combining visual, audio, embodied actions, and print text for responding to and constructing meanings based on specific social and cultural norms (Serafini, 2011).

Engaging in responding and creating multimodal texts requires that students learn to employ a metalanguage for describing or naming specific elements of their texts. It also entails valuing popular culture texts by going beyond binaries between popular culture and canonical literary/mainstream texts to create engaging activities for critical literacy response to both types of texts. For example, in creating a digital comic for responding to *The Outsiders* (Hinton, 1967), students were just as focused on their creative literary responses to the novel than on the technological aspects of creating the digital comic (Weissman and Costello, 2014).

This engagement in the interactive, creative production of multimodal texts goes beyond focusing on visual/digital design to also applying critical media literacy practices related to how texts position audiences (Newell et al., 2016; Serafini, 2011). Serafini (2015) conceptualizes analysis and production of multimodal texts as not only “visual objects” but also as “multimodal events by focusing on elements of visual grammar related to perspectives, composition, use of frames, motifs, method of representation, associations, audience positioning, etc.” (p. 414).

This use of different modes also entails employing different visual/social literacies that are layered (Abrams and Russo, 2015; Chisholm and Whitmore, 2018). These layers include embodied literacies associated with ways of being (Claxton, 2015; Edmiston, 2014) and emotional literacies (Lewis and Crampton, 2016). For example, students responding to Anne Frank’s diary employed

visual responses by sharing images in a classroom, embodied reactions through the use of tableaux performances, and oral/written responses regarding their emotions associated with the Holocaust (Chisholm and Whitmore, 2018).

In doing so, students engaged in four different levels of responses. At Level 1, they viewed the texts to infer various meanings of the texts. At Level 2, students selected one photo to respond to the embodied meanings related to the people in the photo, such as the expression of their eyes to convey certain emotions—application of “embodied” and “emotional” literacies. At Level 3, students applied specific essential questions associated with the curriculum to respond to these texts. At Level 4, students shared their responses with peers in ways that fostered alternative perspectives on the multimodal texts (Chisholm and Whitmore, 2018).

Understanding the use of different modes also entails analyzing how people design and assemble multimodal texts over time using a range of various tools (Roswell, 2013). In her case study analyses of filmmakers, clothes/web/videogame, designers, book illustrators, musicians, composers, stage designers/actors, architects, and journalists, Roswell (2013) found that they drew on their childhood use of specific modes for creating multimodal texts inspired by previous workers’ texts. These experts also perceived their work as highly collaborative and that they could teach multimodal design practices to others.

Concepts constituting responding to and creating multimodal texts

There are several different concepts relevant to understanding how people construct meaning in responding to and creating multimodal texts.

Social semiotics

Underlying theories of multimodality is the concept of *social semiotics* related to defining the social and cultural meanings of different signs (Beemer and Kress, 2008; Hull and Nelson, 2005; Smith, 2019; Unsworth, 2008). Social semiotics theory focuses on using semiotic affordances of specific modes, for example, how an image assumes unique meanings within a particular setting as a “semiotic landscape” based on a participant’s knowledge and attitudes (Hewitt, 2008, 2014; Pantaleo, 2014). As described by Jewitt (2014), the “meanings in any mode are always interwoven with the meanings made with those of all other modes co-present and co-operating in the communication event” (p. 15). Modes are socially-constructed, and audiences interpret these modes’ meanings based on their ways of being and becoming. For example, students may associate the meaning of status-symbol images in advertising of cars, clothes, or beauty products related to their class or gender identities (Gee and Hayes, 2011).

Audiences also define social semiotic meanings based on their alliances with their social groups’ discourses, tastes, or ideological stances (Adami, 2015). For example, the homepages of two British food blogs, The Diary of a Frugal Family (FF) (<https://www.frugalfamily.co.uk>) and Thinly Spread (TS) (<https://thinlyspread.co.uk>), differ according to the appeal to different social classes. The FF blog employs a traditional linear, vertical blog format associated with print texts. The TS blogs use a more complex, modular layout consistent with online newspapers related to more contemporary online texts. The esthetic appeal of FF is “playful, for children, chaotic, spontaneous, amateur and authentic [while] TS instead shapes itself as minimalist, professional, carefully balanced and planned [can] be associated ... with the tastes of different class fragments and lifestyles” (p. 59).

Transmediation

A related concept is *transmediation* is associated with the translation of meaning across different sign systems to create new meanings, requiring students to engage in innovative, critical thinking (McCormick, 2011; Siegel, 2006). Transmediation involves going beyond reproducing knowledge or ideas, for example, retelling a story through drawings, to transforming meanings as in how drawing a storyboard for responding to or creating a video of a story requires thinking about multimodal implications (Mills, 2015; Smith et al., 2016b). Transmediation also involves redefining one’s intentions to exploit the affordances of the use of specific digital tools. For example, students creating a digital video using drawings in a storyboard consider the affordances associated with thinking about how those drawings mediate employing digital video/editing tools in creating a video.

Transmediation also involves a focus on knowing how to transfer multimodal features—images, video, audio, music, text, etc., across texts based on the use of particular design and esthetic practices (Beach et al., 2017). Through responding to visual effects, gutters, and speech bubbles panels in the graphic novel, *Around the World* (Phelan, 2014), students then transferred that experience to create their graphic novels (Napoli and Sychterz, 2015).

Transferring multimodal features as “transmedia navigation” involves students’ use of meta-language to reflect on reasons for employing certain features to achieve desired audience responses (Jenkins, 2006). In creating a video based on clips from a Romeo and Juliet film (Luhman, 1996), students employed meta-language to describe how they were using specific shots and angles to generate their video of a scene from the play (Burn and Durran, 2006; cited in Unsworth, 2011). Students may also reflect on how they employ certain similar practices across modes. For example, a student noted how in writing stories, she manipulates the development of time to generate suspense in the same manner as in creating music based on shifts in time (DePalma and Alexander, 2015).

It is also useful to consider how traditional print literacies apply to multimodal literacies related to transfer across different contexts. For example, learning to engage in the close reading of print texts may transfer to responding to multimodal texts, while close reading of multimodal texts transfers to reading print texts (McDermott et al., 2017).

Transfer across different contexts is more likely to occur when students are engaged in collaborative learning (Smith, 2017). College students used their Whiteboards to collaboratively critique and generate alternative versions of Play-Doh ads (Sobko et al., 2020). This focus on the use of multimodal digital tools expands notions of collaborative learning to include “(1) the convergence of human and non-human actants, (2) within a synchronous or asynchronous network, (3) facilitating and facilitated by shifts in knowledge and thinking, (4) in service of multiple and competing goals” (Sobko et al., 2020, p. 50).

Affordances

Another key concept related to how objects, artifacts, or digital tools serve to create multimodal meanings of texts is *affordances*. Affordances of navigational tools allow for automatic steering of airplanes, boats, or cars. Similarly, the affordances of particular objects, artifacts, or digital tools provide a means for engaging in specific actions or meaning-making (Harste and Kress, 2012). In responding to multimodal texts, for example, a website, students are drawing on the affordances of multimodality, collaboration/interactivity, ubiquity/authenticity, shared productivity, portability, and personalization/adaptivity for responding to how images, music, videos, or text on a website allow students to generate particular meanings (Beach, 2012) (see Fig. 1 below).

Students acquire knowledge of the multimodal affordances associated with the use of particular apps for responding to and creating texts (Beach and O’Brien, 2015a; Hutchison and Beschoner, 2014). For example, the ShowMe app allows students to import images to their devices to draw on an image and record an audio description of their drawing to share online. Students studying genetics in a science course created doodle images using ShowMe to portray cell mutations for presentations to their class (Beach and O’Brien, 2015a).

Students also draw on the affordances of digital tools to engage in collaborative, multimodal sharing of responses to and creating texts (Burnett and Merchant, 2018a,b; Leander and Boldt, 2013; Smith, 2019). Digital tools provided semiotic affordances associated with collaborative visual focus, shared embodied participation, and accessibility constituting creative, collaborative interactions between users (Newell et al., 2016; Rogers and Lindley, 2004; Wohlwend, 2017). 5-and-6-year-olds used iPads for doodling images in pairs using the iOS or Android Kids Doodle app.

In contrast to drawing doodles with paper and pen, students were more likely to engage in a shared gaze and physical proximity when working with the iPad than with their drawing (Sakr, 2018). Children were more engaged with the Kids Doodle app’s use given their surprise with shifting displays and color than with their drawings.

Students employed Diigo yellow sticky notes to collaboratively add and respond to each other annotations for responding to a text about measurements of emissions in a science class (Castek et al., 2014). Students perceiving each other’s sticky notes as including useful comments served as a sensory appeal. Students then wanted to pry open their peers’ notes to read each other’s annotations, leading to interactions between students in a collaboration conversation.

Students also employ screencasting apps such as ShowMe or VoiceThread to collaboratively respond with annotations to images or video clips (Beach and O’Brien, 2015a,b). Students enacted collaborative relations using VoiceThread to respond to students’ creation of images of clay figures to portray a chicken (Walsh, 2010).

Fig. 1 Affordances constituting use of multimodal tools for responding to and creating texts.

Emotions

Students associate certain emotions as actions with the meanings of material images, objects, or physical locations in responding to and creating multimodal texts associated with continuities across time and space to address questions, such as “What is important to us? What is salient? What matters? What is desirable? What is judged to be normal versus novel? What possible relationships that we can imagine do we feel to be more probable or less so?” (Lemke, 2012a, p. 65).

A focus on resonance involves determining how certain practices are employed and shared across spaces and time based on how emotions serve to build connections across time as space (Stornaiuolo et al., 2017). For example, readers acquire the meaning of Harry Potter over time and space in responding to book covers, films, computer games, and commercial artifacts (Lemke, 2012b).

In creating animations using iPad apps, students identified how they portrayed the characters’ emotions by using specific visual images to engage their audiences (Mills and Unsworth, 2018). To do so, they learned to employ metalanguage for describing the expression of emotions such as sadness, anger, or joy through words, images, gestures, or embodied actions. Mills and Unsworth (2018) noted how their characters’ body language conveyed certain emotions as students drew and revised their animations to express those emotions.

Engaging in multimodal response and production in time and space

Researchers studying responding to and creating multimodal texts as literacy events recognize the need to perceive literacy events as open, porous, and continually evolving in time and space (Hollett et al., 2018; Pyles et al., 2019; Scollon and Scollon, 2003). Focusing on the open-ended nature of events leads to the analysis of a “literacy-as-event” enacting of positive relations through the use of different modes (Burnett and Merchant, 2018a,b, p. 9).

One challenge in thinking about response and creation of digital texts is the issue of a “text-centricity” framing of the meaning of texts as failing to consider how the meaning of texts is enacted through users unfolding, novel activity as shaped by emotions and embodied actions (Leander and Boldt, 2013). These “text-centric or discourse-centric perspectives on the production of subjectivity ignore movement and sensation [that] prompts us to interpret backward from texts to practices—to infer literacy practices from textual forms, even when other aspects of social practice are clearly evident” (Leander and Boldt, 2013, p. 33). The result is that “episodes of practice become dominated and misread as they are sifted and pushed through textual funnels such that much that characterizes practice become sorted out, pushed aside, ignored” (p. 33). In their analysis of two male adolescents responding to manga texts, the meaning of their responses derived from their social interactions enacted through unfolding, indeterminate, embodied actions.

Unfolding vs. text-centric

Participation in social media often involves unfolding, decontextualized interactions across time and space (Beach and Tierney, 2016). Posting videos online triggers unfolding responses, as evident in the example of an adolescent female posting a video on TikTok posing the question as to whether math is based on any reality resulting in 1.3 million viewing and millions more with reposting on Twitter (Haigney, 2020). This momentary, unfolding interaction is part of “the natural life cycle of a thing on the internet—a viral video, a meme, a piece of writing—to come loose from its context and take on a plethora of meanings ... this is not so much the relaxing of context as the willful ignorance of it” (Haigney, 2020, p. 8).

These momentary, unfolding experiences with multimodal texts suggests the need to study the response and production of multimodal digital texts within the context of users’ actual, unfolding, embodied activity instead of adopting a “text-centric” perspective. Analyzing these experiences involves adopting a “transliteracy” perspective to examine practices for responding to and creating multimodal texts as “practices of placemaking—ways of making meaningful spaces for learning through interactions with others, with things, and with the natural and built environment” (Stornaiuolo et al., 2017, p. 78).

Students also engage in these experiences by transferring their literacy practices in reading print texts to reading multimodal texts such as graphic novels based on images, captions, panels, and speech balloons (Gillenwater, 2014) as well as practices for remixing and recontextualizing digital texts in creative, multimodal ways (Domingo, 2014). For example, a student composed a digital story using Snapchat to portray images of his experiences of daily everyday events (Wargo, 2015).

Students participating in virtual spaces also engage in alternative multimodal practices for interacting with others in time and space. Young students interacted in the three-dimensional, virtual world of “Barnsborough,” as a deserted town in which they, as avatars, engage in online chat as they move around different spaces and discover clues as to why the town is deserted (Burnett and Merchant, 2014). One student, John, used the virtual chat log to interact with avatars in the town and talk with his lived-world peers in the classroom as different layered literacies based on his previous experiences in various virtual and lived worlds. Analysis of this virtual world suggests the importance of examining movements across different times and spaces associated with the virtual and blurred material (Burnett and Merchant, 2014).

In another example of an experience of multimodality in time and space (Leander and Hollett, 2013), a team of literacy researchers shared their responses to the graphic novel *Th3 Anomaly: Crossing the Rubicon* by the author/artist, Landry (2016) (Leander et al., 2017). Rather than a text, Landry created the novel in the form of 300 paintings housed in an art gallery to create an interactive space for viewers’ embodied responses to the paintings. As one researcher (Roswell) noted, in this novel “modes are

culturally shaped and subject to cross-cultural ways of knowing and seeing. This presents a challenge to the text-based stance of multimodality. Instead, multimodal meaning-making can be linked to the movement of bodies in space” (Leander et al., 2017, p. 108).

Creating “digital geographies” of places

Redefining notions of virtual spaces and time entails recognizing how people engage in “mediatized worlds” (Hepp and Krotz, 2014, p. 8), constituted by virtual space and time transcending the local through interactions on a global level (Beach and Tierney, 2016). Students employ digital tools or apps to generate alternative, multimodal representations as “digital geographies” mediating their mobile participation within and across specific sites and spaces, as evident in the use of GPS tools on devices/phones related to “neogeography” multimodal mapping practices (Burnett et al., 2014; Hollett et al., 2018, p. 152).

Users of mobile device apps such as FourSquare and Yelp can also create digital texts based on specific locations associated with layering annotations or texts to location sites (Hollett et al., 2018). Students employed VR tools such as Google Street View to engage in virtual field trips associated with studying a specific location related to what they are studying. For example, the “Poetry 4 U Project” connects poems to specific locations to enhance audiences’ sense of place associated with a particular poem (Berry and Goodwin, 2013).

For the Visual Communication Design program at the Manukau college campus, South Auckland, New Zealand, students wrote poems or selected a poem related to a specific location with the Manukau region associated with certain emotions, autobiographical events, cultural associations, etc. (Sinfeld and Cochrane, 2018). They also created images/videos, using AR tools such as Wikitude and Google Street View to add data to the images/videos related to mapping their location. Students noted that using these tools enhanced audience interactivity with their productions and how they experienced novel, innovative use of tools to generate multimodal experiences. Instructors at the RMIT School of Education, Australia, created a virtual school space, Lathner Primary, that allows preservice teachers to interact with teachers and their peers regarding their instructional practices (Faulkner and Latham, 2010). Students at RMIT University share their multimodal digital texts using the Climate Action Adventure! web application that combines virtual learning contexts with social media platforms and climate data to address climate justice issues (Rousell et al., 2017).

Students add data or information to Wikimapia.org or OpenStreetMap that involves users and audiences in “new forms of reading and writing the world—a new ethos that goes beyond the digital media space afforded by previous, sedentary technologies” (Hollett et al., 2018, p. 155). They can also experience multimodal representations of climate change effects related to extreme weather events, droughts, melting glaciers, sea rise, or flooding (Beach and Smith, 2019; Starsielski and Walker, 2016). For example, in the Visualizing Change project, students created multimodal, 3D representations of change over time. They could then portray melting glaciers or sea rise based on a relatively rapid rate of change (O’Neill and Smith, 2014). They also used Google Earth Timelapse tool to analyze changes in glaciers melting over three decades. Students at the University of Lisbon, Portugal, created digital art for portraying their concerns about climate change (<https://artforadaptation.com>) (Bentz, 2020).

Teachers have also employed virtual reality (VR) and alternative reality (AR) tools to have students engage in a virtual spatial experience that can then transfer to their analysis of lived-world topics or events. For example, in an “ecomobile” project, students collected data from a virtual pond to then analyze the water quality of a virtual pond to then apply to their classroom analysis of water quality (Kamarainen et al., 2013). Preservice teachers at the University of Arizona studying climate change visited the Biosphere 2 (B2) lab biosphere2.org for studying the earth’s ecological systems and biospheres (Beach et al., 2020). They collected audio, video, and 360 interactions for their digital storytelling productions for use in their teaching to create a video of their tour, as well as developed a lesson on growing food on Mars.

Fostering responding to and creating multimodal texts in the classroom

Fostering students’ engagement in responding to and creating multimodal texts in the classroom entails adopting practices beyond literacy instruction based on print-based literacies associated with adopting alternative activity systems (Kalantzis and Cope, 2012; Shanahan et al., 2014). This involves analyzing how the affordances of tools serve to achieve certain outcomes within a community constituted by adopting different roles and adherence to specific rules. For example, students in a fifth-grade science class studying the environmental effects of acid rain used Hyperstudio for users to click on images to access information about these effects. A ninth-grade teacher used a music video to model the creation of multimodal poems using audio and visual tools (Shanahan et al., 2014).

Smith (2014) reviewed 76 research studies on instructional activities for fostering adolescents’ multimodal composition. Students experienced higher engagement levels when they could choose their topics associated with a focus on popular culture, music, manga/anime, fanfiction, or video games associated with personal issues in their lives. They benefited from collaborative production through learning to assist each other in using digital tools to achieve a group’s goals. Students from non-dominant backgrounds used their multimodal productions to portray their lives in different cultural contexts in ways that were not possible through traditional, print-based literacies.

Smith’s review also found that teachers and peers assume important roles in providing scaffolding related to the use of digital tools for generating multimodal productions by acquiring a metalanguage for reflecting on the use of tools. Students also learned to

engage in recursive production/composing processes associated with planning, videotaping, and editing over time. However, both teachers and students in these research studies experience tensions and challenges associated with acquiring production practices requiring the need to not romanticize their experiences as an idealized alternative to traditional print-based instruction (Hull, 2003).

For teaching *Macbeth* based on the theme of curses, students generated and shared video presentations that drew on clips from movies portraying curses (Marlatt, 2019a,b). In the classroom, the teacher adopted a more facilitator role instead of a lecturer role through modification and redefinition of instruction. Simultaneously, one challenge related to using multimodal digital tools in the classroom has to do with the disparities in online access and the use of digital devices/apps related to economic and class inequalities (Mills, 2010).

Responding to multimodal texts

In responding to online digital texts, students are engaged in clicking links to explore other texts in a dynamic, unfolding process so that texts, consistent with a transactional theory of response (Rosenblatt, 1993) are no longer isolated, decontextualized entities (Pet et al., 2014). Navigating multimodal texts involves interacting with a text by using different pathways or processes based on a text's design features related to layout, subheads, visual images/graphics, etc. Responding to multimodal texts involves adopting the roles of "(1) navigator, (2) interpreter, (3) designer, and (4) interrogator" images related to the use of a text with a particular social, ideological, or cultural context (Serafini, 2012, p. 153).

Loh and Sun (2019) found that students who enjoy reading were more likely to use their phones or devices for reading e-books or articles. In contrast, students who did not enjoy reading were more likely to use phones/devices to interact on social media or play games. Students are also increasingly responding to and creating texts within and outside the classroom through the use of multimodal practices, instead of relying solely on print texts, requiring a marked shift in instruction that builds on the use of these multimodal practices (Beemer and Kress, 2008; Cartner and Hallas, 2020; West, 2019).

Responding to images and illustrations

Students benefit from instruction on inferring intertextual links between images and texts through understanding how images and language portray events. In contrast to reading instruction in the Western world based primarily on print words/texts, children in China acquire initial literacy practices primarily through immersion in images in texts designed to socialize them about schooling (Bin and Freebody, 2010).

For responding to children's books or graphic novels, students learn how to draw on their semiotic knowledge of images to recontextualize the meaning of images and illustrations related to books' or novels' narrative development (Lysaker, 2018; Pantaleo, 2013). In responding to the wordless book, *The Other Side* (Woodson and Lewis, 2001), a fourth-grade student engaged in intersubjective retelling of images portraying events as a co-author based on his lived-world experiences associated with a relational sense of belonging with the characters (Lysaker and Wessel-Powell, 2019). Middle-school students responded to the use of images in two children's books to support the story development based on how the books positioned them as readers (Unsworth and Macken-Horarik, 2015).

In addition to responding to images in texts, students also use images to enact their responses, for example, generating drawings or sketches on large pieces of paper for responding to *The Odyssey* (Zoss, 2019). For responding to a picture book, *The Red Piano* (LeBlanc and Barroux, 2009) portraying a young girl in a Chinese re-education camp, students used an iPad camera to create photos of pages from the book. They then used the Popplet app to generate written responses to images within boxes to connect the boxes to specific aspects of the book's images. They may also use audio responses, as did students using iPads to add the images and sounds to a description of a windstorm from the novel, *The Big Dry* (Davis, 2013), including writing their descriptions of their images/sounds (Zammit, 2016).

After freewriting about a poem, students created multimodal responses to the poem by listing words or phrases related to a poem's perceived tone (Pet et al., 2014). They then selected images to create tableaux that arranged images to convey their experience of a poem's tone leading to writing another freewrite comparing their initial response to their new response (Pet et al., 2014). They then used these responses to create their metaphor poems. Their use of multimodal responses and their creation of poems fostered visual/audio experiences, intertextual, affective connections, multiple layers of meaning, and enhanced discussions.

Students also use artwork—for example, for responding to *The Pearl* (Steinbeck, 1947), by creating a wire sculpture with a hand holding some pearls to portray characters' obsession with obtaining the pearls (White, 2019). To portray conflicts between the two brothers in the novel *Fighting Ruben Wolfe* (Zusak, 2000), a student drew images that included boxing gloves and a heart to portray the brothers' love for each other (White, 2019). To portray changes in the main character, Melinda, over time in *Speak* (Anderson, 1999), students used layering of translucent tracing paper with images of drawing of trees that portray rougher and harsher aspects of the tree to show Melinda coping with difficulties in her relationships over time (Hartman et al., 2019).

As part of their participation in literature circles, students engaged in producing short video productions for responding to texts such as *Into the Wild* (Krakauer, 1996) about how the central person, Christopher, made mistakes in exploring the Alaskan wilderness resulting in his death (Marlatt, 2019a,b). Students created a satiric film posing as a guide for surviving in the wild as a mock documentary portraying mistakes made by the main character.

Students also draw on their prior experiences and expectations with multimodal texts to engage with current texts, for example, knowledge of both multimodal and game literacies based on specific design features for engaging in actions as they move through interactive literary texts or games (Hsu and Wang, 2010; Partington, 2010; Wyatt-Smith and Elkins, 2008). Students responding to the Delight Games interactive fiction app drew on game social semiotic practices for making narrative choices based on their previous experience with multimodal game semiotics, including the use of embodied actions related to their participation as avatars (Hall, 2019).

Responding to graphic novels and comics

Graphic novels and comics continue to be popular for young readers, particularly given how the combination of images and words, along with the use of panels and gutters, serve to scaffold and motivate readers' experience (Botzakis et al., 2017; Griffith, 2010). In response to a traditional print novel versus graphic novel format, sixth graders preferred the graphic novel format (Moeller, 2016).

Readers learn to infer how multimodal, visual features of light, color, lines, and shadow serve to engage readers as co-authors (Smetana et al., 2009; Low, 2012). Teachers have also employed graphic novels versions of canonical literature, such as the graphic novel version of *Othello* (Zarate, 2011), that provides visual scaffolding to help students respond to the play (Wolfe and Kleijwegt, 2012). Analysis of eighth-grade students' think-aloud responses to multimodal features in *Episode 2: Italy in Inanimate Alice* (Pullinger and Joseph, 2012), found that students focused on the images and sounds/music as a means of understanding the text (Karchmer-Klein and Shinas, 2019).

For responding to graphic novels in a college course, students created video essays that included content from both the novels and online video essays related to engaging images, minimal use of written text, and use of audio/voice to convey key points (Miller, 2019). In a related study, students received instruction in design/art elements with layout, perspectives, framing, color, typeface, framing, panels, speech bubbles, and physical construction of graphic novels (Pantaleo, 2013). For responding to the graphic novel, *Sidekicks* (Santat, 2011), students focused on using color, point of view/perspectives, or exaggerated character poses/expressions related to enhancing narrative plot intensity and mood (Pantaleo, 2013). Students used Comic Life to create comic book versions of the novel *The Outsiders* (Hinton, 1967) in ways that enhanced their aesthetic transactions with the novel (Weissman and Costello, 2014).

Responding to digital videos

A survey of 1600 US 8–18-year-olds found that they devote an average of 1 h daily to viewing online videos (Rideout and Robb, 2019). This raises the question of whether, in viewing these videos, students are focused not only on the use of cinematic video techniques but also on adopting a critical response to underlying cultural or political stances adopted in these videos. In one study, students in an EFL class in a German high school responded to digital stories on YouTube portraying undocumented youth in the US and how they used the media to challenge conservative political framing of immigration issues (Ruhe, 2020). Students responding to three digital stories used emojis and comments to share what they learned about undocumented youth's immigrant's lives; they also searched online posts by undocumented youth. The teacher then provided students with "mode cards" to have students identify different modes employed in the videos related to embodied movements and cinematic techniques, auditory language, captions, and sound related to how these modes serve to convey specific political messages regarding immigration issues.

Students could engage in critical responses to videos using questions from the Center for Media Literacy (<https://www.medialit.org>):

1. Authorship: "Who created this message?"
2. Format: "What creative techniques are used to attract my attention?"
3. Audience: "How might different people understand this message differently than me?"
4. Content: "What values, lifestyles and points of view are represented in, or omitted from, this message?"
5. Purpose: "Why is this message being sent?" (McClain, 2016, p. 40).

Creating multimodal texts

Students also employ tools and apps for creating multimodal texts, such as visual images in argumentative writing (Roque, 2012). In their systematic review of 70 studies in secondary schools, Smith et al. (2021) found that teachers integrate a wide variety of multimodal projects, digital videos, multimodal presentations, and visual projects podcasts, and webpages being the most prevalent. Creating multimodal texts requires instruction for students who were accustomed to writing text-based arguments on Google Docs and their lack of experience with using digital tools on how to employ multimodal approaches to generate their PSA. However, students indicated that they were more engaged with completing the assignment than writing print-based argumentative essays given the higher levels of creativity associated with making choices about multimodal options and that their audiences were more apt to access their productions. At the same time, there was no evidence that their experience in generating multimodal arguments transferred to writing an argumentative essay (Howell et al., 2017).

Teachers in Nepal participated in a project involving creating videos about environmental issues in their communities, for example, lack of water, pollution, and adverse effects of garbage (Walker, 2017). In reflecting on their experiences, these educators

noted that it was through the process of producing videos itself that enhanced their critical awareness of sustainability challenges as a form of conscientization (Freire, 1970) as contrasted with simply studying these challenges, implying that the experience of multimodal production enhances the need to make change in society. Similarly, students who created videos portraying fake news examples were more likely to acquire knowledge about fake news and a sense of political efficacy than students who studied these videos or students who studied the topic of fake news (Geers et al., 2020).

Several studies have shown how students can analyze literature through creating multimodal texts (Beach et al., 2017; Curwood and Gibbons, 2009; Jocius, 2013). By composing through multiple modes, Smith (2018, 2019) found that multilingual youth could explore literary themes and the affective dimensions of literature. For example, one group of 10th-grade bilingual students expressed what they viewed as the main theme of “oppression versus freedom” in the short story, Harrison Bergeron (Vonnegut, 1961), multimodally in a digital video. They filmed creative scenes of themselves wearing masks and layered voiceover narration with dramatic music to emphasize their interpretation. Through multimodal literary analyses, students also had the semiotic space to express their identities, appeal to different audiences, and make cultural connections to other media (Smith, 2019) (see Fig. 2 below).

Teachers have students employ zines as hand-drawn texts about students’ lives as an alternative to the written essay, in ways that “give them a chance to play—with form, voice, and message ... that leads them to share a highly curated version of their lives” (Collopy, 2020, p. 28). As one teacher noted, “I think [zines] inhabit this interesting space between public and private and between permanent and ephemeral that is still a meaningful one” (Collopy, 2020, p. 29). (Aragon et al., 2018, includes extensive resources on teaching zines).

For sharing multimodal narrative writing, students employ story-sharing apps such as Wattpad or Figment for adding or responding to others’ narratives (Korobkova and Collins, 2018). On these sites, older adolescents perceived themselves more as readers and novice writers than the professional writers on these sites than younger adolescents who perceived themselves more as writers who use their peer groups to identify their writing ability (Korobkova and Collins, 2018).

Using remix in creating multimodal texts

A primary practice in creating multimodal texts involves using remix of texts through alternative modes (Lankshear and Knobel, 2011). For engaging in a remix, students are drawing on how genres and memes operate in specific social contexts to play with or subvert these genres and memes (Bowen and Whithaus, 2012).

Generating remixed texts involves consideration of how different modes interact with each other in different ways. In a professional development seminar, teachers created multimodal memoir writing using a remix that included images, video clips, music, or audio podcasts to portray specific events or episodes from their memoir (Meixner et al., 2018). Teachers employed four different interactions between modes: (1) “symmetrical: two modes share the same message,” (2) “contradictory: two modes connote opposite meanings; establish tension,” (3) “complementary: two modes interdependent; fill in the gaps,” and (4) “metatextual: two modes explicitly show the act of composing: highlight design” (p. 500).

The increased use and popularity of YouTube videos have led to remixing and re-appropriation of video content related to “spreadability” (Jenkins et al., 2013), often based on producers and audiences’ shared knowledge of specific genres or memes. This shared knowledge leads to generating unique remixes of videos within a genre or meme (Adami, 2014). For example, a video, “The Harlem Shake,” of a man dancing to a song followed by a jump cut to others dancing spawned the Harlem Shake Meme with thousands of video responses from around the globe, including critiques of the expropriation of African American cultural practices by Whites (Koehler, 2013).

One primary mode in remix involves audio as music, voiceovers, sounds, etc. that contribute to the meaning of a remix based on “embodied knowledge” constituting the meaning of specific spaces (Gershon, 2011). Productions on the Youth Radio podcast as

Fig. 2 Scene from a video created by 10th-grade students who analyzed literary themes from a short story (Smith, 2019).

“soundscapes” includes remix use of music, sound effects, spoken-word poetry, and digital photography as “converged literacy” (Soep and Chávez, 2010, p. 47).

In creating remix video book trailers, one student employed both slow and fast/loud music to accompany her trailer’s portrayal of Holden’s experiences in *The Catcher in the Rye* (Salinger, 1951). Another student included images of African Americans living in poverty for responding to *Native Son* (Wright, 2005) (Baize, 2019). Students also draw on experiences with popular music videos to create remixes based on embodied experiences and images portrayed in music videos (Bazalgette and Buckingham, 2013). For example, a group of high school students created a video depicting a student being transformed into a character in a graphic novel world to engage in a dream of his peers dancing to popular music video songs in different spaces in the school (Beach and Swiss, 2010).

Students also employ multimodal remix productions for civic engagement related to addressing issues in their school or community (Mirra and Garcia, 2017). Students in one school created a bulletin board about the portrayal of women of color in the media that included texts with QR code links to a YouTube video remix for display in their school’s hallway (DeJaynes and Curmi-Hall, 2019). The students also enacted counter-storytelling through photos of themselves with bar codes over their eyes and words associated with stereotypes associated with their racial identities. For example, one Asian student included the terms, “Martial Arts,” “Straight A’s,” “Anti-Social,” “Dragon Lady,” “Small Eyes,” “Glasses,” “Chinese,” next to her photo (p. 304).

Researchers have also identified different types of remixing practices. Analysis of teachers interacting with each other on a MOOC course using Twitter, Google + Community, Facebook, and blog posts employed four types of remix practices (Smith et al., 2016a,b). “Bursting” and “drifting” were associated with the proximity and pace of remixing. When teachers received a newsletter that contained images with some prompts, “What sense do you make of the story? If you were to put words to it, what would it say? What songs would it sing?” one teacher created a remix of these images using his images and adding some music. Other teachers also created their remixes for enacting collaborative stances. Teachers in the course also engaged in “drifting” through innovative, experimental uses of apps, such as the use of emojis and animated GIFs with images.

Teachers also employed “leveraging” and “turning” practices that served to enact social relationships as well as disrupting power hierarchies. They used “leveraging” practices by employing tweetchats and Google Hangouts and making explicit how they work collaboratively as a community by using these tools. There were also instances of “turning” related to ruptures regarding the overall purpose of their interaction. One teacher posted images associated with immigration, leading to debates about the relevancy of that issue within their CLMOOC community.

In designing instruction for engaging students in remix, teachers employed an authoring tool (Strategy Tutor, developed by CAST, Inc.) that involved remixing different prompts, media, and agents (Dalton and Smith, 2014). In an analysis of 26 teachers who published their lessons to a publicly available database, Dalton and Smith (2014) found that teachers integrated a wide variety of modes in media in service of literature-based or content-based learning goals. Three design approaches and goal orientations emerged. Most teachers provided students with a multimodal immersion experience to enhance their understanding and engagement with literature or other subject-matter learning. These teachers took advantage of the media on the Internet, linking to websites that included at least bimodal representations, and more typically, multimodal representations.

Digital storytelling

Students also engage in digital storytelling through the use of resources from the Center for Digital Storytelling (<http://www.storycenter.org>), Digicom Learning (<http://digicomlearning.com>), StoryCenter (<http://www.storycenter.org>), or the University of Houston’s Center for Digital Storytelling (<http://digitalstorytelling.coe.uh.edu>). In creating digital stories, students draw on remix practices to combine images, video clips, audio, and text to create settings, characters, and narrative development.

Middle school students working in teams as part of the Project Imagine the Future (<http://imaginefuture.org>) assumed roles of writers, scientists, and designers to collaboratively create digital multimodal science fictions remixing comics, pictures, videos, infographics, and Scratch often related to climate change (Jiang et al., 2019; Smith and Shen, 2017). A key component of their productions has to do with students’ collaboration by assuming roles related to their expertise in using certain multimodal literacy practices in ways that helped them envision future identities. One student who assumed the role of scientist noted that “I want to be a forensic scientist. My character [in the sci-fi narrative] also became a scientist after saving the world” (Smith et al., 2019, p. 54) (See Fig. 3 below of students’ book covers).

Fifth-grade students composed digital stories in response to reading historical fiction novels (Kesler et al., 2016). They employed certain multimodal tools to portray their responses, including examples of other stories, use of storyboards, websites for free access to images, music/sounds, and digital cameras/voice recorders. One group responding to *The Gold Cadillac* (Taylor, 1987) created a digital story based on country and Chicago blues music and drawings and slides to portray a family’s move from Ohio to the segregated world of Mississippi in the 1950s. The slides include images of signs of “WHITES ONLY!” “COLORED WAITING ROOM,” and “WELCOME TO MISSISSIPPI/IT’S LIKE COMING HOME” (p. 59).

Students creating a digital story for *Roll of Thunder, Hear My Cry* (Taylor, 1997) portrayed children in the Logan family having to walk three and a half miles to and from their school while the White children road a school bus (<http://tinyurl.com/koo9hlp>). One of the images is a drawing of the White school bus driver frowning through the bus window as he drives the bus down a muddy dirt road in a storm to imply his sense of power. A subsequent slide portrays the bus going by the Logan children, who then scramble into a gully to avoid the mud splashing on them with music from *Jaws* playing in the background.

A research review identified reports of the use of digital storytelling and photovoice exhibits for participation in civic engagement projects by documenting issues in their schools or communities, leading to addressing those issues (Greene et al., 2016, 2018).

Fig. 3 Multimodal science fictions created by middle school students that explored socioscientific issues (imaginefuture.org).

These reports include students challenging stereotypes in schools (Rogers et al. (2014); declining physical conditions in neighborhoods in Detroit (Graham et al., 2013), Pittsburgh (Teixeira, 2015), and Latinx communities in southwest Texas (Guajardo et al., 2016); homelessness in Los Angeles (Garcia et al., 2015); and the experience of Native American students in Alaska schools (Wexler et al., 2013). They also include examples of middle school students of color engaged in a YPAR project to document how they engage in making change (Pellegriano et al., 2016).

Teachers in the Palm Springs school district reported using digital stories to generate texts as both fiction and nonfiction to enhance writing, learn collaboration, assess learning, and use projects to connect to their communities (Vu et al., 2019). Surveys of students who engaged in creating these digital stories based on this instruction indicated higher technology self-efficacy levels than peers who did not create digital stories. These students learned to employ a wide range of digital tools and apps and engaged in digital production practices. Students creating a digital story in response to citizen surveillance issues, as portrayed in 1984 (Orwell, 1950), demonstrated more insightful responses to the novel and retained more information about the novel than students who wrote an essay about the novel (Vu et al., 2019).

Engaging in meta-reflection and assessments of multimodal practices

For teaching composition, Jody Shipka (2011, 2012) problematizes equating multimodality using only certain kinds of new-media digital texts, for example, use of a digital story or blog post. She posits that using only certain kinds of digital texts leads to “freezing” writing as a static entity instead of writing as a set of unfolding literacy practices for engaging in action (Prior, 2009).

Given that students engage in multiple rhetorical decisions as they compose texts, Shipka asserts the importance of focusing on and having students engage in meta-reflection awareness to make explicit how they select and employ certain multimodal practices. She favors giving students problems that “require students to consider how the contexts in which texts participate shape the way those texts are received and responded to ... [through] attending to how language, combined with still other representational systems, mediates communicative practice” (2012, p. 78). For example, one of her students, Muffie, a dancer, worked on creating a video about her dancer peers (Shipka, 2011). To reflect on her planning processes, Muffie generated a set of drawings depicting instances in which, for example, she viewed a similar, previously made documentary by another student about dance and how she attempted to organize her peers for engaging in dance.

For reflecting on multimodal video production in a college composition course, a student envisioned how her appeals to online audiences related to her need to make revisions with those audiences in mind (VanKooten, 2016). She noted that “editing is revision; if there is one thing I have learned through English, it is that revision is as important as actually writing the paper” (p. 68). The student also described the importance of her shifting her use of music: “my favorite part [of the video], I swear, is the part where there’s music and it fades away. I like the seriousness of the moment, and I think I found a new appreciation for a shift in a paper” (p. 68).

Students can engage in this meta-reflection on how their multimodal texts achieve certain uptakes related to engagement in certain rhetorical context using criteria based on the Multimodal Assessment project: artifact (finished product), contexts, substance (content, quality, and significance of ideas presented), process management and skills, and habits of mind (National Writing

Project, 2011). For recording think-aloud reflections about processes for creating multimodal texts, students can use screencasting apps such as ShowMe or Explain Everything (Abrams, 2014).

Using criteria for meta-reflection requires going beyond framing context as conforming to specific formalist criteria to how their multimodal texts serve to create contexts for building relations with audiences (Gallagher, 2014). For example, a student reflected on creating a multimodal e-portfolio about the limitations of traditional schooling as itself a digital book with an introduction, cover, preface, and tabs (Gallagher, 2014). She noted how the rhetorical context could “cause the viewer to interact with images of historical and more outdated photographs of the education system as well as more modern ones” (p. 7).

Teachers can also create videos to model self-assessments. In a course for teachers, teachers generated blog posts regarding how they would employ multimodal tools for their instruction by reflecting on how the multimodal course design itself fosters their learning (Cartner and Hallas, 2020). Teachers noted the value of the visible course design based on criteria for their self-reflection associated with outcomes and activities based on teachers’ practical needs, for example, an activity in which they addressed two questions related to teaching with multimodal texts.

Implications for instruction and assessment

One of the major challenges for instruction and assessment is that much of schooling continues to revolve around verbocentric, print literacy practices, and evaluations in ways that marginalize responding to and creating multimodal texts that are now prevalent in students’ lives outside of school (DePalma and Alexander, 2015; Quinlan and Curtin, 2017; Ranker, 2015).

Another instructional challenge for engaging students in responding to and creating digital media is that approximately fifteen to sixteen million students, particularly for students in rural and/or low-income homes, and 300,000 to 400,000 K-12 teachers, lack adequate Internet access and/or owning devices needed for responding to or creating digital media (Chandra et al., 2020). For example, 26% of Latinx, 30% of Black, and 35% of Native American students lack access and/or devices. Having adequate access involves having a minimum of 25/3 Mbps (download/upload speeds) given that it takes 3 min to load a 30-min video in contrast to 9 min for a slow 10/3 Mbps. This suggests the need for both state and federal governments as well as digital/media companies to provide students with free or subsidized access to address these inequalities.

Assessing students’ multimodal responses and productions entail the development of criteria that differs from use in assessing responses to and production of print texts, for example, assessing students’ creation of advertising videos based on criteria related to attention, interest, desire, and action (Silseth and Gilje, 2019). In responding to the same assignment, one student employed more verbocentric writing consistent with his need to conform to the teacher’s evaluation based on composing process models, while another student employed more multimodal productions through a video consisting of thousands of photo images that were less consistent with the teacher’s criteria (Jocius, 2017).

One factor limiting a shift to multimodal instruction is that some large-scale standardized testing driving school curriculum is based primarily on print-based literacies. For example, while the Australian National Curriculum includes a strong emphasis on teaching multimodal literacies, the reading tests of the Australian National Assessment Program in Literacy and Numeracy (NAPLAN) contained little focus on multimodal literacies (Unsworth et al., 2019). The *Making News Today* project at the University of Wollongong, Australia, employed an alternative pre-post assessment of multimodal practices that includes images and texts from news and media. Students responded to open-ended questions requiring students to generate written answers on a website leading to assessing students learning overtime based on ratings of the extent to which students engaged in formulating and supporting claims and used intertextual connections (Brown et al., 2010).

This increased use of assessment that includes responding to and creating multimodal/digital texts will only enhance an increased instructional focus on responding to and creating multimodal/digital texts central to students’ daily lives within and outside of school.

A man's work is nothing but this slow trek to rediscover, through the detours of art, those two or three great and simple images in whose presence his heart first opened.

Albert Camus.

The designing of the disaster

The Institution of education will be reimagined for a post-COVID-19 world. The cascading disasters of 2020 created a classroom “catastrophe” jump from one paradigm to another: from print to digital media. After decades of gradual assimilation of computing within schooling, suddenly classroom instruction worldwide went online, exposing the incommensurability of literate pedagogy and digital technology. Electracy (the digital apparatus) dates from the beginning of the Industrial Revolution, in the later eighteenth century, which is to say that one of its identifying features is the Anthropocene (the epoch in which human activity began to modify the planetary environment). Here is the responsibility to be confronted in an electracy education: nature and culture have merged; *the cause of world catastrophe is us*, humanity itself. There have been four apparatus (the term is both singular and plural) in the history of civilization, beginning in the paleolithic era some 80,000 years ago: orality 10,000 years, (Western) literacy 3000 years, and electracy 300 years ago. The insight of grammatology (the history and theory of writing), is that technologies of language and communication are one part of a tripartite apparatus (desiring machine): part ideological and part technological. The operation of apparatus in history was not noticed until the twentieth century, when the cumulative effects of electronic civilization raised awareness of the limits of (Western) literacy, the nature of its historical shape, emerging from orality in Classical Greece, and giving rise to “secondary orality” (as Walter Ong called it) in modern times.

“Apparatus” (*dispositif*) is a term favored by the *Tel Quel* school in France (1960–1982), the journal that published works by many French poststructuralists. The French provided most of apparatus philosophy, while the Toronto school (Marshall McLuhan, Eric Havelock, Walter Ong among others) provided the scholarship. The prototype apparatus of literacy includes three interrelated but independent inventions, one of which is technological (alphabetic writing). After the Greeks acquired alphabetic writing (about 1000 BCE), Plato created the first school, the Academy in Athens (387 BCE), opening a “chora,” a region of new reality within the dominant orality of his era, with an original metaphysics of science (mathematics). Within the Academy the students began inventing the operating practices of literacy, codified by Plato’s student, Aristotle, who founded his own academy, the Lyceum. The third dimension of invention involves identity experience, individual and collective. Havelock (1963) argued that individual selfhood and the related political order of democracy are as much inventions of literacy as alphabetic writing and school. Socrates is a syncretic figure, partly oral, partly literate, the first person to experience Self. This history is familiar, noted to make the point that each apparatus produces an original metaphysics (world view account of reality) including *technology*, *institution formation*, and *identity behavior*. Metaphysics accounts for space, time, and cause, and directs all resources of a civilization to manage ultimate cause in the interests of human thriving. Paleolithic was animistic, regarding everything as alive, using magic to promote survival (life/death). Orality identified divine cause, creating religion and the institution of the church to address right/wrong behavior mandated by God. Literacy identified nature as cause (*Physis*), creating true/false logics of science to manage material laws. Electracy opens a new chora, with humanity as cause, including a metaphysics of attraction/repulsion. This history should be taken into account when organizing education native to the digital apparatus.

The optimistic side of this history is that the digital apparatus is invented, as an actualization of human desire, and not merely an affordance determined by technology: humanity and technology evolve together in a dialectical dynamic. The caveat is that whatever the digital apparatus is becoming, it is not more literacy. Is it any easier for a literate scholar to accept electracy than it was for a church theologian to accommodate science? The trial of Galileo is a cautionary tale. Walter Ong warned against such terms as “oral literature,” a phrase he called “preposterous,” because it masked the incommensurability of oral and literate productions (Ong, 1982). The same must be said about “digital literacy,” not in its narrow usage for learning “best practices” of authoring online, but as a frame for understanding education native to an apparatus whose causality is not accounted for by magic, religion, or science. The complementary relationship of digital literacy and digital humanities with electracy is evident in this context, in that the functions of the former up until now have been to adapt computing technologies to the metaphysics of school, similar

to religions of the book adopting alphabetic writing but not scientific metaphysics. Reviews of digital humanities discuss how information sciences augment critical thinking native to literacy. There is an analogy between concept formation in literacy and data mining. The concept as a category of reason was discovered in patterns made accessible through scanning the oral record visualized in writing. Justice is the first concept, created in the *Republic* when Plato went beyond Hesiod's topical collections of dramatic situations of (in)justice, such as the anger of Achilles in the *Iliad*, to ask, "what is justice itself?" Distance reading (text data mining), introduced by Franco Moretti, similarly is revealing new patterns in the digitized archives of print not discernible to scholarship. Apparatus history suggests that these patterns hold major unforeseeable consequences for knowledge creation.

James Watt's steam engine (1775), The French Revolution (1789), and Immanuel Kant's *Critique of Judgment* (1790), are three threshold events marking the inception of electracy. *Climate Change* stands in for all *hyperobjects* (Morton, 2013) created by and exceeding control of scientific (literate) civilization, with posthuman significance (in which human survival and thriving are not prioritized). The apparatus of science (including literate schooling, individual selfhood and the democratic nation state) has become a victim of its own success. Scientific civilization produced a generalized sprawl, overrunning every physical and informational category and limit, resulting in an historical crisis of the formless (addressed in the recent field of border theory). Virilio (2003) testified through his Museum of Accidents to the impasse created by digital speed, light-speed technologies creating real-time feed-back loops collapsing all dimensions into Now, overwhelming the time and space essential to critical thinking. Virilio's description of the claustrophobic closure of the world upon itself due to the dimension collapse he called *dromosphere* (dromos = -speed) has become accessible to individual intuition in conditions of home quarantine required by the pandemic. The quarantine serves as collective existential epiphany.

Hopes for engineering solutions through technological progress are delusions, Virilio observed, since technology itself has become a primary driver of the Anthropocene. Every invention includes its own accident: the invention of the car includes the car wreck. Virilio warned of the *General Accident*, that happens everywhere simultaneously, with disasters such as Chernobyl representing harbingers. The Internet Accident has happened already, with the pollution of the public sphere by cyberwarfare, contributing significantly to the erosion of democracy. The COVID-19 pandemic is the most complete instance of a General Accident to date, exposing the limitations of the existing world order.

Virilio lamented that dependence on computational algorithms of calculation in all areas of productivity eliminated *analogy* as a resource of thought and imagination.

Digital technology is a filter that is going to modify perception by means of a generalized morphing, and this in real time. We are faced with something which is more than the failure of the traditional static arts, both visual and plastic: we are faced with the failure of the analogical in favor of calculation and the numerology of the image. Every sensation is going to be digitized or digitalized. We are faced with the reconstruction of the phenomenology of perception according to the machine.

Lotringer and Paul (2005, p. 66).

Virilio's concern recalls Plato's warning in *Phaedrus*, that writing would destroy living memory. Virilio suggests *digital imaging will destroy perception itself*. Plato's Academy began inventing a new metaphysics adequate to the artificial memory of writing. Electracy must do the same for the constructed (fictional, deep fake) phenomenology of the digital apparatus.

The more familiar usage of "apparatus" is in the phrase "Ideological State Apparatus," (ISA) used by Louis Althusser to describe the institutions responsible for educating citizens to become productive members of society (Althusser, 2001). Ideology represents the imaginary relationship of individuals to their real conditions of existence (which are not knowable directly). The alternative to ISA is RSA, the Repressive State Apparatus (the police, for example). The difference between managing social cooperation by ideas versus force was manifested in the protests following the murder of George Floyd. Citizens are *interpellated* (invited, solicited, called) to their preestablished position in the social order, according to the culture, customs and traditions of identity categories (the WASP order in the tradition of patriarchy). Althusser's analogy for the iconic *gest* of this call, especially telling in our context, was that of a police officer approaching a group, commanding "hey you there!" and the one who turned around to answer is interpellated. We recognize our place in the system.

The authors of a recent special topic issue on Digital Humanities for *PMLA* declared ideological critique of identity as a priority:

We reassert a fact that we believe to be self-evident: that DH must concern itself deeply with race, gender, disability, economic and linguistic access, and other intersecting axes of power embedded in our materials and methods as demanded by this troubled moment in the world.

Booth and Posner (2020, p. 10).

Critique of ideology, and critical analysis in general, are inherently literate, applying analytical reason to the Western tradition itself and against humanism as a compromised metaphysics. There are good reasons for this critique within literacy. Electracy calls for an *aspect shift*, however, to regard the "humanities" in DH from the point of view of apparatus, as resources for creativity across all disciplines, essential to education's response to the Anthropocene. Hans Blumenberg's insight into the relation of secularization to Christianity applies to our project also, which *reoccupies* the questions of the traditional humanities while replacing the conventional answers (Blumenberg, 1983). The insight of apparatus is that the four primary institutions of ISA—Family, Church, School, Media—are precisely the primary institutionalizations of apparatus (Paleo, Oral, Literate, Electrate), each originating in its own epoch,

with its own metaphysics, coexisting historically now, and in need of attunement into a tempered “stack.” The challenge of electracy pedagogy is to discover how we are positioned within these institutions and how to take control of this positioning on behalf of individual and collective well-being.

Heuretics

Students learn electracy by helping to invent it. Having the same root as “eureka,” heuretics is classified as “obsolete” in the O.E.D., defined as the use of theory to invent, as distinct from hermeneutics, the use of theory for interpretation. The difference between hermeneutic humanities and heuretics is similar to Thomas Kuhn’s distinction between normal and revolutionary science (Kuhn, 2012). The logic of normal science has been simulated in AI expert systems, for addressing routine problems whose solutions are codified within the paradigm of the discipline. When anomalies accumulate to the point of putting the paradigm in question, revolutionary science emerges in original hypotheses formulated by certain creative individuals. Holton (1973), historian of science, studies such creative figures to understand the ability to think beyond a paradigm. Holton noted that science includes three primary dimensions. Two of the dimensions are taught in the disciplines—those concerning how knowledge is verified (normal science): empirical facts (the archive of theory-dependent materials); analytical operations (mathematics, logics for manipulating the materials)—object of study, and method of study.

The third dimension (not taught in most schools) concerns how knowledge is discovered, refocusing on the subject who invents, dependent on analogies outside the range of algorithms (hence Virilio’s concern about the elimination of analogy in favor of algorithms). This difference has received attention, especially in periods following great calamities, in the hopes of finding a logic of creativity, so far with little success. Holton named this third discovery dimension “thematic,” to indicate its origins in the presuppositions, the dispositions specific to individuals, constituted in part by received cultural archetypes, and in part by idiosyncratic experience acquired in childhood, which is to say that creativity is grounded in that order of common sense resistant (so far) to AI simulation. The thematic order manifests itself in an intuition of reality, a dispositional feeling about how the world works or how one wants it to be. Original hypotheses, it seems, are part of a larger order of positioning, “position” being “thesis,” one’s standpoint or stand: diathesis (state of mind), aisthesis (sensory perception). Northrop Frye referred to literature not as fictional but “hypothetical,” an observation that calls attention to literature as an archive of themata, expressing underlying intuitions about reality. The core of most of Anton Chekhov’s stories, for example, is said to convey his life feeling of the mutual isolation of human beings and the impossibility of understanding each other. A rich vocabulary surrounds “thesis,” including Heidegger’s *Gestell* (enframing), a synonym for *dispositif* (apparatus). Heidegger (1977) remarked the ontological importance of disposition, which is essentially what he meant by *Dasein* (being-in-the-world). If digital technologies give us GPS (physical location), electracy takes up the challenge of metaphysical orientation, EPS (Existential Positioning System). This context of thesis becoming thematic reveals what is at stake in our aspect shift regarding ISA, in that the recognition experience of ideological interpellation is a clue also to one’s unique disposition (*Dasein*). One imagines within a specific hegemonic cultural order in the same way that one speaks a native language. Disposition is the site of human cause, chora of electracy metaphysics.

A figure guiding reoccupation or retrieval (cf. McLuhan and McLuhan, 1988) of the humanities is Amartya Sen (Nobel Prize laureate in Economics, 1998), who argues for an economics of well-being (Sen, 2009). The pragmatic takeaway is that happiness is literally profitable, although the main point is to expand the measures of productivity. Sen defines justice as an inalienable human right to develop one’s capabilities to their fullest potential. A society that supports individuals’ capacity to choose their own life possibility will prosper economically (Sen, 2009). The capability movement, taken up also by the philosopher Nussbaum (2011), retrieves virtue ethics, as Sen acknowledges, and even the tradition of human “faculties.” The understanding of being in terms of human virtues, powers, abilities, extends from Plato to the present, in a heritage including Aristotle’s *Entelechy*, Leibniz’s *Monad*, Spinoza’s *Conatus*, to Heidegger’s *Dasein* and *Ereignis* (event). *Conatus* (*striving to persevere in one’s own being*) perhaps best defines what is at stake in electracy pedagogy, taking ownership (enownment) of our responsibility for the Anthropocene as *the creativity accident*. This pedagogy is personal, with students receiving the tradition as guide to their own capabilities. In our aspect shift we focus on the core lesson of how the faculties (virtues) operate within culture, repeated in many variations, with the same structure throughout history.

Paul Gauguin’s experience in Tahiti introduces the traditional questions to be reoccupied in electracy pedagogy. The moment is 1897, late in his career, in a state of mind (diathesis) informed by despair and disillusionment due to debt and illness. Gauguin decided to paint his final testament and then commit suicide. He painted a masterpiece, but the suicide attempt failed. The title of the fresco-size painting is, “Where Do We Come From? What Are We? Where Are We Going?” The art critic Hal Foster declared this work to be the catechism of modernism itself, the title drawn from Gauguin’s upbringing in the Catholic faith. Reading from right to left, the scene depicts three groups of figures in Gauguin’s Fauvist style of portraiture, expressing the passage from birth to death, with each grouping symbolically associated with one of the three questions of the catechism. It is a visualization of the force of being, of *Conatus*, that Derrida calls “trace.”

The assignment structuring the curriculum of disposition is for students to discover variations on these questions and ultimately to answer them relative to their own situations (EPS). An unpacking of the catechism opens a vector through the entire Western tradition (expandable to other traditions as well). Plato established a comprehensive version of the capabilities, including individual and collective dimensions (microcosm and macrocosm). The *Republic*, Plato’s dialogue outlining the ideal city of literacy, correlates the three faculties or virtues—Reason, Will (Spirit), Appetite—with Head (rulers), Heart (guardians), Viscera (workers). Aristotle updated the virtues into their definitive form: *Theoria* (knowledge of necessity, nature’s laws known through science); *Praxis*

(ethics and politics, not amenable to science because involving human choice); *Poiesis* (aisthesis: craft, making, *techne*). In Aristotle's *Entelechy* entities become what they (already) are through time, actualizing their potential, realizing their form in matter. Acorns become oaks in time. The art of education is responsible for the actualization of human potential (Sen's economics doubles as a theory of education). Human essence is happiness (Sen agrees), but it may be achieved only collectively, in a polis (Republic), through human choice and productivity. The portmanteau term *theopraxis* indicates the requirement of human intelligence to integrate the virtues into one performance. *We wanted Happiness but produced Anthropocene*. Such is the fundamental aporia (tragedy) of civilization that makes humanity uncanny, Heidegger said.

Immanuel Kant revised Aristotle in his three Critiques outlining the limits, functions, and *relationships* of capability. The Critiques treat Understanding (Pure Reason, *Verstand*) dealing with laws of nature; Reason (Practical Reason, *Vernunft*) treats moral freedom. Kant's innovation, the third Critique, the Judgment of Taste, promoted aesthetics, the capacity to enjoy beauty, the experience of pleasure and pain, the dimension of sensory appetite, to equal status as a faculty, not traditionally acknowledged. Kant's Copernican revolution is an aspect shift, regarding Aristotle's categories not as in nature but rather as human capabilities. The categories space-time-cause are in us, not the world, enabling all experience, thus positioning humanity as responsible for what it makes (the Anthropocene). Kant set the agenda for electracy pedagogy, assigning to aesthetic judgment the task of bridging the irreducible gap, the abyss, separating the actualizations of pure and practical reason, that is, science and religion, laws of nature and human freedom. We may recognize in this *aporia* the condition to which *fetish logic* responds, the human capacity to support contradiction, to oscillate between aspects: *I know what is the case, but still I believe otherwise*. As we learned from Wittgenstein's exercises with the duck-rabbit optical illusion (the Necker Cube Gestalt shift), this seeming glitch in the sensorium is also a power, precisely the power of toggling aspects or points of view, in conditions oriented not by identity (as in literacy) but difference.

Electracy can be understood in terms of Kant's hypothesis that aesthetic judgment is the key to attuning the faculties and related ISA institutions, an argument reiterated more recently by Hannah Arendt. Kant anticipated Gauguin's catechism, asking in the context of his three Critiques: *What can I know? What should I do? What may I hope?* (how does the world work; how should I behave in such a world; how do I feel about this behavior). The mythological version of the questions dramatizes the aporia. The theme is the Judgment of Paris, the contest of the Golden Apple, awarded to the most desirable goddess by Paris of Troy. The competition was among Athena (Wisdom), Hera (Political Power), Aphrodite (Fertility), whom we recognize as our three faculties personified. Each goddess bribes Paris, who decides in favor of Aphrodite in order to possess Helen, the most beautiful mortal woman, leading to the Trojan war disaster. Plato's solution was that of time and process, a passage of ascent beginning with sexual desire, which draws one into the customs of marriage and social relations, subsequently through love to recognize Beauty itself, the pure form (Idea). Botticelli, commissioned by the Medici in Renaissance Florence to visualize this Neoplatonic lesson, attempted to condense the passage, genesis, or trace of being into a scene of the birth of Venus out of sea foam. Michel Serres adopted Aphrodite rising from the sea as the emblem of *chaosmos* (order emerging from complexity)—the scene of *chora*.

Theopraxis

Theopraxis is a portmanteau term to signify the importance of syncretizing the abilities beyond thinking: *theoria*, *praxis*, *poiesis*. The practical application of theopraxis begins with testing the mode of *reflective judgment* that Kant proposed for integrating dissociated faculties, such as in the extreme breakdown of the sublime, when circumstances overwhelm both the archive of concepts and the productive imagination, as has become the norm in formless conditions of alienation. As a symptom of apparatus disorientation, the sublime sets the agenda of electracy to augment imagination (*poiesis*) to the same degree that literacy augmented theoretical reason. Reflective judgment is the ability to create an original category for a multiplicity of perceptions out of the pure relations immanent in the materials. The modality of reflective judgment (as opposed to determinate judgment operating through existing concepts) is pleasure-pain in the experience of beauty or ugliness, and attraction-repulsion in the sublime, the breakdown of perception and loss of intuition. The sublime is defined as the simultaneous experience of attraction and repulsion, the defining axis of electracy, the equivalent for the digital apparatus of true/false for literacy, right/wrong for orality, life/death for paleo. Categories formed without concepts by aesthetic design support sense-making native to electracy. Kant anticipated a new mode of autopoietic (self-organizing) causation (*chaosmos*).

The consequences of Kant's aspect shift are manifested in the revolution across the arts, their inward turn to perform their own formal "critiques" as operations in their own right, and as extensions of the human sensorium rather than as mimetic representations. Theopraxis may be observed in Alan Kay's creation of the Graphical User Interface (GUI). Participating in the development of the personal computer in Xerox Park in the 1970s, Kay recognized the need to harness all the capabilities orienting people in experience. His interface design engages the Symbolic dimension of language (*Theoria*) in the keyboard and code; the Enactive order (*Praxis*) of action, movement, the hand control of a mouse; the Imaginal (*Poiesis*) in the visual figures of the eye with windows and icons. Donald Norman, Director of the Design Lab at UC San Diego, developed a program of experience or emotional design, integrating the three faculties, articulated as: Reflective (intellect, useful); Behavioral (effective, usable); Visceral (appearance, desirable). Testing proved a correlation between usability and desirability. We are back at Sen's vision, that happiness has economic value.

A final point to make about capabilities concern the "popcycle," the stack or cognitive (conative) map, the EPS by which citizens orient themselves in reality. The Anthropocene is sublime, a dromosphere of collapsed dimensions, meaning that the challenge of electracy education is to restore orientation by overcoming alienation that broke the continuity between individual experience of agency and collective forces of energy in the world, everything from global capitalism to quantum physics that exceed individual intuition. The popcycle (transversal circulation of invention through the apparatus) proposes to restore the micro/macrocsm

continuity through insight into recapitulation, witnessing the relationship between phylogeny and ontogeny, the correspondence or homology between the four institutions of apparatus and the body with its three virtues. The old question regarding whether history has a direction (if not a goal), in this context, must be answered affirmatively in observing this correlation of institution and virtue, just as Plato proposed (although without his hierarchy), and as assumed within traditional cultures of world civilizations (the mandala principle). By the time children are five years old, they have been interpellated into and become native practitioners of four different metaphysics, four discourses (epistemes), collectively generated by human capability, but fatally unsynchronized.

We are born into a family, the institution created in the paleolithic (goddess culture), in which we gain control of our body. It is worth pausing to consider this primal scene of instruction of infants that Julia Kristeva called the semiotic chora, in which imagination is formatted: weaning from the breast, sensory-motor standing and walking, bowel control, learning to speak. Erikson (1982) described the developmental vectors relating this early apprenticeship in embodiment with the social orders of knowledge, law, play. These behaviors produce “part-objects” emerging in transitional space (mother-infant fusion, the first chora), relating oral-anal-genital-voice-gaze appetites, informing all subsequent learning and behavior. EPS orientation augments this embodied foundation of human intelligence, setting an (impossible?) agenda for AI, or even artificial theopraxis (AT). Apparatus education continues with children taken to church, mosque, synagogue, temple, and otherwise introduced to moral norms of right and wrong (orality, praxis). By age four children enter formal schooling, introduced to the metaphysics of reason, evidence-based thinking of true/false, the laws of nature and history (literacy, theoria). Meanwhile, at some point early on, children enter into media culture through the screens transmitting entertainment into the home, projecting the corporate commodity metaphysics native to electracy. We take this assemblage for granted, and yet the conflict and contradictions among the institutions are patent from the beginning, not only within individuals and among the members of a family, but historically in the hot and cold wars of McWorld and Jihad. The 9/11 attack summarizes the macrocosmic conflict, integrating as it does religious motivation (orality), capitalist target (electracy), and scientific technology (literacy), intended to destroy bodies (paleo). This event symptomizes the disaster, the chaos of capabilities, well documented in infinite variation in the cultural archive.

The visceral turn

What is the metaphysics native to electracy? This question brings us to the challenge of apparatus as a frame for education, concerning what makes it “preposterous” to characterize our epoch as “digital literacy.” The point of estrangement is that *electracy institutionalizes human visceral appetite*. It does for appetite what literacy did for reason, orality for will, paleo for the body itself, which is to say that the institution of electracy functions with a reality principle of attraction/repulsion (the experience French psychoanalysis calls *jouissance*), superseding right/wrong, true/false, or even life/death. This *differend* (constitutive incommensurability) is the aporia (impasse), the barrier inhibiting our ability to counter the Anthropocene, which is resistant to the concerns of families, churches, and schools. *The institution of appetite is the corporation*, especially the entertainment corporation, but in general the function of the corporation as prosthesis of collective sensory viscera, organized by attraction/repulsion. Given the differend separating school from corporation, the immediate question concerns the terms of a pedagogy capable of attuning or tempering the full apparatus cycle (theopraxis).

Kant’s Judgment of Taste is well-named to introduce the heuristics of electrate pedagogy. The “discovery” of America by Columbus (whose statues are now coming down around the world), was an accident of the sense of taste, emblem for the Anthropocene. The story is familiar but unappreciated as symptom of apparatus shift. Columbus was seeking a new route to India to allow Spain access to trade in pepper, a trade that, expanded to include all spices, became the first hyperobject. Pepper was one of the most valuable commodities in the world over its six-thousand-year history. The movement to rename Columbus Day as Indigenous Peoples Day is well-meant, to acknowledge the genocide that accompanied the event, but it would be more apt to call it World Pepper Day, ritualized by abstaining from visits to the grocery store Spice Aisles for a week. It has to be recognized that people love pepper in electracy the way they love God in orality or truth in literacy. It is further proof of Virilio’s insight into the General Accident. Genocide of Indigenous People is the pepper accident.

The Spanish Conquista was carried out primarily by private enterprise licensed by the Crown. The first corporation was the British East India Company, created in 1600 (the Dutch counterpart just two years later), establishing a monopoly to engage in the spice trade. This institutional invention involved the legal innovation of limited liability, which solved the problem of risk management with respect to raising the enormous amount of capital necessary for the business, giving us the stock market. This invention has a long history, associated with inventions in mathematics, especially statistics and probability, motivated by attempts to hedge bets by gamblers. The history of capital tells of a continuing struggle to escape the mimesis of risk, with the latest installment being the “credit default swap” that produced the bubble and crash of the Great Recession (2007–2009). Finance still awaits its own Jackson Pollock, although cryptocurrency bears watching as a site of invention.

When Galileo faced the Inquisition over his claim that the earth moves around the sun, he assured the theologians that his interest was only with the laws of nature, material entailments leaving in place their divine cause. The theologians refuted Galileo’s toy telescope with their own instrument of proof, the rack. The choros of spirit and nature, created within orality and literacy respectively, actualize the potentiality of Praxis and Theoria. Gregory Bateson acknowledged this apparatus differend when he observed that the past two and a half millennia of civilization could be accounted for by two terms: *sacrament* (religion); *entropy* (science) (Bateson, 1979). A third term is needed to mark the emergence of electracy. That term is “commodity,” the nature of which is evoked by identifying El Chapo (Shorty) as the Galileo of electracy: drug lord, ruthless head of the Sinaloa Cartel that supplied eighty

percent of the US market in cocaine, heroin, meth, and marijuana—the contemporary spice trade—earning some one hundred billion dollars annually. People love drugs, and the mayhem associated with the trade is the drug accident.

Drugs are a commodity, commodity being an invention of corporate capitalism as prosthesis of human appetite. It is abject by standards of the previous apparatus. Such is the conventional critique of the corporation, as in the epic theater of Bertolt Brecht, that the new identity behavior of the digital apparatus is the mafia (collectively) and the prostitute (individually). Benjamin (1999) identified the poet Charles Baudelaire as the first modern person because he experienced himself as a commodity and the city as a market. El Chapo as the Galileo of electracy makes explicit the differend, the barrier that makes electracy as metaphysics unacceptable to school, church, family. And yet it is us, our accident, our Anthropocene. The presidency of Donald Trump holds some of the same lessons, manifesting paradigmatic abjection. His credentials qualifying him as the first electrate (in the worst sense) president is his status as a billionaire of shady real-estate deals and a reality TV star. Most telling is his trading in conspiracy theories and science denial, introducing a politics that is literally uncanny in its exposure of the unofficial dimension of social life kept out of view until now. His administration exposed the limits of literate collective identity and the need to reimagine the political and ethical order itself, beyond selfhood and democracy into brand franchising in a way that promotes well-being rather than disaster.

Our post-COVID reimagining requires an aspect shift, to accept the sublime experience of attraction/repulsion (*jouissance*) as a capability, a primary human faculty, to take up the project inventing synergy among the faculties and their institutions. Let us review the elements of electracy as metaphysics (technology, institutional form, and identity behavior). *Technology* is manufacturing, the machine age of the Industrial Revolution, and the associated inventions of recording—photography, telegraphy, phonography and the like, evolving into the Information Revolution. The corporation is the *institution*, realizing the capitalist mode of production. Our apparatus analogy helps notice the relevance of certain events, such as recent Supreme Court decisions (Citizens United, 2010) confirming the standing of corporations as persons, whose speech is money and as such protected by the Constitution. The analogy is with Thespis, the legendary inventor of tragedy (a transitional form moving from ritual to theater): Thespis was the first actor to step out from the ritual chorus and speak as an individual. This event in the invention of selfhood in literacy has its equivalent in the emergence of the corporation as a collective entity or macro-subject, a kind of Leviathan, whose appearance stimulated the formation of its counterpart, the Proletariat. Critics have noted in this context that corporation behaviors match FBI profiles of sociopaths (a diagnosis applied to Donald Trump himself). In apparatus terms we understand that what corporate Leviathans are doing is not reasoning or worshipping but *enjoying*. They are not so much speaking as twerking with money. This enjoyment is not an aberration but a human capacity suppressed in previous apparatus and becoming hegemonic in electracy.

What of the *identity* dimension of electracy? The new behavior emergent in electracy is consumerism: *brand* supplementing soul and self, modeled in celebrity stardom—the experience of oneself as an image. The commodity form separated exchange value from use value (a necessary step in the creation of any language mode). The first to exploit design thinking native to electracy were advertisers, similar to the sophists at the beginnings of literacy using dialectic for purposes of deception rather than wisdom. Given that the commodity has exchange value, advertisers realized they were selling not the steak (use value, the substance in literate categories) but the sizzle (the accidents of taste, the aesthetics of sensation). Such is the aspect shift in ontology, from a reality of essence and substance, to a reality of accidents and flesh. The reason advertising is so superior to critique, Walter Benjamin observed, is its recognition that *what matters is not what the moving red neon sign says but the fiery pool reflecting in the asphalt* (not the concept but the atmosphere). The culture wars in contemporary politics are about sizzle.

Advertising emblems support desiring in the same way that logical arguments support reasoning. The ad evokes a promise of happiness by triggering a fantasy, an event of electracy. What inferential entailments are to arguments fostering understanding, colors textures shapes are to designs triggering moods (feeling). The insight of electracy is that these moods are an independent capacity equal to and apart from logic or morality, with equal power to organize civilization. The greatest conversion of a civilization since Rome converted to Christianity is that of Christian and ultimately global society to consumerism. Philosophers warn of the dangers of this conversion, in that the commodity form disseminated in entertainment media, circulating part-objects, has tapped directly into human libidinal economy, industrializing and homogenizing the embodied energy source of imagination (Stiegler, 2013). The experience of electracy seen from the point of view of literacy is the series of *Matrix* films.

Electracy opens a new chora governed by a native ontology, a new understanding of *thing*, as theorized in psychoanalysis. Humanity itself is metaphysical cause in electracy, and psychoanalysis is the best account we have of visceral cause. Aristotle is credited with inventing the literate thing (substance) and codifying in his categories the ten statements possible to make about anything using declarative propositions, limited to the neutral modality of true/false. These categories remain in force today, condensed into the five *Ws* of journalism: *Who What When Where Why*, manipulated within alphabetic media, vehicle of reason, and dismissed in electracy as fake news. Meanwhile, Aristotle's truth tables, joined in a bachelor machine with Leibniz's binary numbers and Tesla's logic gate, meet in electronic computing to write true/false at light speed. Literacy put true/false into a machine and gifted it to electracy, to be applied in emergent ways, just as orality put speech into writing and gifted it to literacy. The object of electracy is *das Ding*, to use Freud's term, naming object relations (it is a relation, not a substance). Kristeva (1982) revised Freud and Lacan to situate the formation of this new kind of thing in the pre-Oedipal period from birth to eighteen months, the period of sensorial apprenticeship. In this period the child's first object forms, *the transitional object* as Winnicott called it, simultaneously within and outside, parent and child at once, a moebius topology for a homothetic imagination (extimacy). The energy of electrate chora comes from the initial event of satisfaction undergone in this potential space of infancy, giving rise to the fantasy of lack retrospectively constructed as defense against anxiety. The fantasy of the *object-cause of desire* (not what is desired, but desire's cause), Lacan's *objet petit a* or object @ (the little other, embodied in part-objects, produced by and separated from the fragmented

body), inspired by Winnicott's transitional object, circulates among bodies through media, structuring deep memory, experienced as *attraction/repulsion orienting the reality of electracy*. This cause is not logical but catalyzed by fiery pools of aesthetic design. The political order today must be reimagined in terms of this aesthetic articulation of need, demand, and desire (Three Graces of psychoanalysis). The political order in every apparatus emerges in relations formed at the intersection of the faculties (Fukuyama, 2002). This intersection is the fundamental interval requiring augmentation in AI, AT, even artificial unconscious. Again, it is worth repeating, the digital apparatus augments the commodified object @ just as the alphabetic apparatus augmented the propositional thing.

The insight of electrate ontology is that the universal exchange enabled by the general equivalent of commodity form supports this visceral dimension of human imagination (*poiesis*), potentially activated by any trivial item or detail invested with libidinal energy (its prototype is PTSD). It is the motivational "butterfly effect" of chaos theory. The change from one apparatus to another includes a shift in the functioning of the human sensorium—dominance of the hand in paleo, ear in orality, and eye in literacy. Kant's taste registered the new priority of the contact senses over the distance senses of the previous orders. The libidinal chora clarifies that the electrate sensorium is organized by what Lacan calls *lamella*, a fantasy organ unifying the erogenous zones of the body. Lacan explicitly compared his topology of the subject, the Borromean rings (knot) relating the Real, Symbolic, and Imaginary (RSI), held together by the drive of object @, with Aristotle's *theopraxis*, thus confirming the consistency of the capability structure through history, self-evident also in Freud's Ego, Superego, and Id (principles of reality, morality, and pleasure). The pivot of our theme is that, as Heidegger promised, *where danger is, grows the saving power also*. The faculty of imagination is a *pharmakon* (both gift and poison).

Cabaret academy

The pivot into the saving power of electrate education was the creation of cabarets in Montmartre on the outskirts of Paris in the 1880s. It is useful to place this innovation in the context of education, to appreciate its significance for the apparatus. Our framing question concerns how our civilization may reimagine itself against self-destruction. The historical innovation is the French response to losing the Franco-Prussian war of 1870–1872. The treaty ceded Alsace-Lorraine back to the Germans (it had traded hands numerous times). The French did not respond with the creation of a new kind of university, as the Germans had after their humiliating defeat by Napoleon, but instead with a cabaret scene, which hosted (accidentally) the invention of electrate metaphysics. Alsatian patriots began meeting in Montmartre, a site of bohemian counterculture opened in the industrializing city, populated with the abject class Marx dubbed the Lumpenproletariat (the dregs of society). It was a vice district, supplying cheap wine, women, and song, disreputable, as theater districts always have been. The American equivalent is Storyville in New Orleans, scene of the invention of jazz, the music of modernism. The patriots met in the backrooms of bistros, invoking the spirit of Rabelais, *Gargantua and Pantagruel*, especially the utopian Abbey of Thelema, with its motto, "Do what you want." They invoked the *Esprit Gaulois* of carnivalesque wit. The emblem of this inaugural movement was a painting by Manet, one of the founders of modernist art, called *Le Bon Bock* (A Good Glass of Beer), depicting a drinker in Alsatian attire. The cabaret scene of the 1880s included such venues as Le Chat Noir and Le Lapin Agile where artists gathered and formed the Hydropaths and the Incoherents, forerunners of the modernist avant-garde. Modernism actualizes the visceral turn in civilization.

The new state of mind (disposition) nurtured in this environment was *fumisme*, from *fumer*, to smoke (chimney-sweeping, figuratively lackadaisical, slacker, shirker). *Fumisterie* is humbug, farce, parody. It is worth noting that Anna O. (Bertha Pappenheim), one of the first patients to undergo psychoanalysis, referred to the "talking cure" as "chimney sweeping." The bohemian partiers mocked the entire Western tradition for amusement, of which Marcel Duchamp's modified readymade, *L.H.O.O.Q.* (a punning acronym saying "she has a hot ass"), is the prototype—a cheap reproduction of Leonardo's Mona Lisa defaced by a mustache. The poetics of Duchamp's oeuvre remains (for now) the one "style" beyond the powers of AI simulation (Manovich and Arielli, 2022), perhaps calling for revision of the Turing test: not whether a machine can think, but laugh. This new institution culminates in the Cabaret Voltaire, opened in Zurich during World War I, hosting the invention of Dadaism. *Cabaret is the academy of electracy, and Dadaism is its logic*—the Surrealist bachelor machine, exemplified by the meeting of an umbrella and sewing machine on an operating table (collage sampling of an archive). The analogy with the invention of literacy clarifies the micro-level of metaphysical invention. The basic device of literacy is dramatized in Plato's dialogues when Socrates asks an interlocutor to define a term (for Euthyphro to define "impiety" for example). Definition is a practice native to concept formation in literacy, unknown to illiterate interlocutors. Definition (outlining verbally the shape of idea) exposes contradictions in reasoning, with the principle of noncontradiction, identity, the excluded middle, as the primary operating rule of logic.

Our analogy prompts us to look for the equivalent micro-device articulating visceral mood functioning within digital media. This device was invented in the modernist arts, the exemplar being Paul Cézanne's *passage*. Cézanne's "faceting" of planes (point of departure for Cubism subsequently) introduced a device for working with sprawl conditions (formless loss of shape, disappearance of idea, blurring of figure-ground relations). The discovery included a new way to represent three dimensions on a two-dimensional surface, by exploiting *the little sensation* of aesthetic perception apart from concepts (enabling reflective judgment). His post-mimetic space was created by addressing the *involuntary* perceptual operation of the human sensorium—cool colors recede and warm colors advance. The importance of this optical effect in art history reminds us that cinema is based on the *phi* phenomenon, the optical illusion by which still images are made to move. Lacan adopted it as analogy of the Phallus illusion in the unconscious. Electracy emerges within the gathering of modernist arts, cinema, and psychoanalysis around the involuntary operations of perception.

The equivalent device in electracy of noncontradiction in literacy is that bringing this little sensation into design opens a practice for managing the autotropic experience of human visceral orientation in the world. Sensation metaphysics, augmented in digital technology, builds out the human demand for self-stimulation, the appetites of sensory organs (the lamella) engaged through consumption of every kind, from drugs, coffee, spice, to body-to-body replication of behavior accomplished by watching sports, movies, pornography (accounted for by the discovery of mirror neurons). The insight of libidinal economy is that at the heart of this drive for satisfaction is the lost impossible object @, fusion engine of the Anthropocene (human dis/satisfaction). The autotropic body must be educated to thrive in the light-speed feed-back loops of dromosphere. This program is part of the aspect shift away from critique to heuristics. The shift is from exclusive attention to communication within the "I-s/he" system, to the "I-I" system. "The place of auto-communication in the system of culture," the Russian semiotician Yuri Lotman observed, "is far more significant than is commonly supposed" (Lotman, 2000, p. 21).

In electrate ontology *flesh* replaces Aristotle's substance, flesh being the term the phenomenologist Maurice Merleau-Ponty used to name the dimension of being revealed in the works of modernist painters such as Cézanne and Paul Klee. Marcel Proust dramatized the signature scene of the little sensations in his novel, *In Search of Lost Time*. The little sensation triggers involuntary memory for Marcel when he bites into the madeleine, the tea biscuit he first tasted as a child, served by his beloved grandmother. The incident is catalytic, which is the electrate equivalent of analytic in literacy, provoking in Marcel's case *an experience of happiness* that motivated the composition of his novel in search of the origins of this feeling. Merleau-Ponty adopted Proust's memory as methodology. These events of flesh testify to the existence of a visceral *value*, manifested in aesthetic qualities: intensity, vividness, participation, at the level of primary being, *the feeling of being alive*. The modernist arts originating in cabaret entertainments researched and experimented with the formal properties of design addressing the human sensorium, to augment these values and their catalytic effects on memory and imagination. In the context of apparatus, Virilio's warning about digitizing phenomena becomes an exact description of flesh actualized within electrate metaphysics. *Electracy designs flesh*, just as literacy writes speech.

A reason for insisting on the cabaret setting of the invention of the vanguard aesthetic revolution is to notice its context not only as entertainment, but the setting of vice, the attractions and dis gusts of desire and appetite. Electracy undertakes a revaluation of all values (Nietzsche). The (impossible) imperative today: *reimagine vice*. The revaluation of appetite is most explicitly embodied in the themed casinos of Las Vegas, such as the Venetian or the Bellagio, family-friendly capitals of vice. Walt Disney, codifying if not inventing the theme park in Disneyland, is the Plato of electracy, actually building his model polis devoted to happiness and knowledge. To appreciate this analogy, we have to consider the micro-level of design. What is the sensation-operator of Disneyland? Sergei Eisenstein, inventor of cinematic montage, praised Disney for his revelation of the power of the *plasmatic line* (plasma = shape, equivalent of Eidos, Gestalt, Idea). Eisenstein had in mind the first animated sound cartoon, Disney's *Steamboat Willie* (1928). Eisenstein spoke for his peers in his admiration for Mickey Mouse, whose popularity at the time was rivaled only by Charlie Chaplin. The key for electrate metaphysics is that this line, originating as the line of depiction in the caves of the paleo apparatus, is not restricted to the naturalism of photography, but exceeds all mimesis to articulate an imagined fictional dimension in which shape may be distorted and reassembled according to its own formal potential guided by imagination. The energy of this line is what Derrida (1974) identified as trace, referenced in the *gramme* of grammatology (the trace of electracy). Most telling in the context of capability is the comment by designer John Hench, responsible for the portrait celebrating the 25th anniversary of the creation of Mickey Mouse, that the cartoon figure in graphic terms is a symbol of life, expressed in the circular curves of the mouse (the overlapping circles that resonate with the Borromean knot of Lacan's subject topology). "The curves suggested fecundity, regeneration, babies and breasts, the lost safety of the womb, the life impulse itself" (Snow, 2019, p. 115). Aphrodite wins again. This world mouse personifies electrate thing. Hench characterized Disneyland as the architecture of reassurance, even if for its critics Disneyland is judged as the happiness accident.

The analogy between Plato and Disney affords a systematic comparison of apparatus: (1) Academy, school/Disneyland, theme park. (2) Science, reason/Entertainment, fantasy. (3) Dialogue, discourse/Cartoon, animation. (4) Socrates, dialectic/Mickey Mouse, gag. (5) Proof, persuasion/Event, enjoyment. The list could continue, as a way to appreciate the historical inevitability of Disneyization, the theming of everyday life now well advanced globally, as the electrate equivalent of secularization by which literacy displaced orality in the social organization of experience. The functional point is to note the opening of chora in each case, of a place for science in school within an oral society; a place for fantasy in theme parks within a literate society. The predictive value of the analogy is to note the trajectory of history, that theming will have become hegemonic in guiding collective thriving (or not), including global policy formation. The cabaret origins suggest that theming of the world is also the bohemianizing of lifestyle: Lumpenproletariat as macro-subject. The specific character of electrate chora is manifested in Disney's intention that entering his park was like Alice passing through the looking glass into another world (before Mickey Mouse, Disney created a series of films mixing live photography and animation based on the Alice story). Slavoj Žižek observed that the best emblem of Lacan's part-object is the grin of the Cheshire Cat.

The place opened to institutionalization by electrate chora has been present in the structure of narrative from the beginning of storytelling. A prototype is *The Wizard of Oz*, which serves as an electrate equivalent of Plato's allegory of the cave. Dorothy begins at home in Kansas, confronting a quotidian life problem—having her dog Toto taken from her to be put down. The tornado that blows her and the house into Oz is the disaster we are generalizing as the Anthropocene, the accident of human cause. The passage from the first to the second act of the narrative, from Kansas to Oz, transports Dorothy into *the other scene*, like Alice through the mirror, the scene Freud called the unconscious, a realm with its own rules and tests for the protagonist, as documented in Joseph Campbell's *Hero with a Thousand Faces*. The bonus in the case of *The Wizard of Oz* is that the companions Dorothy encounters following the yellow brick road—Scarecrow, Cowardly Lion, and Tin Woodman—personify the three capabilities (thinking, willing, feeling),

whose powers are in a state of privation (Aristotle's *steresis*), potential only, virtual, unrealized, like those of students on the quest of education. The lesson of the allegory is that this fictional other scene is now being realized, materialized, objectified in digitalized perception, *constructing a virtual dimension* compensating for the collapse of time and space in dromosphere. In the coming community, reality will be virtual, a dimension imagined until now in the modality of *impossible*, evoked only indirectly. Realization of this virtual order is a pharmakon, manifested equally in Otaku (Japanese) fan culture and QAnon conspiracy movements.

Theming mystory

Disneyland as a hyperreal Republic of fantasy provides instruction in the nature of plasmatic design, a dimension of fiction but not mimetic: a *simulacrum* of place. A Yale professor of Architecture observed this quality of Fantasyland, describing the cable car ride above the castle and through the paper-mache Matterhorn. "Now nobody thinks that mountain is the Matterhorn or even a mountain, or that those bobsleds are loose upon its slopes—slopes being on the outsides of mountains. Yet the experience of being in that space is a real one and an immensely exciting one, like looking at a Piranesi prison or escalating in the London Underground" (Sklar, 1967, p. 80). The comparison with Piranesi is most telling, the highest compliment coming from an Architect, given Piranesi's status as the ultimate designer of impossible architecture.

Another instance of this original dimension, relevant to our example of Gauguin's failed attempt to live his fantasy Tahiti, is a psychologist's description of the effect of the Tiki Room. "In a fake hut, fake parrots play-sang not very estimable tunes, but the colors were a riot of rainbows and the parrots moved their beaks in precision—now this group, now that, never faltering, always surprising. The great totems (Tiki) in various corners of the hexagonal room broke into mobile faces, singing and chanting, and soon the songs of men and birds were joined by the songs of flowers. It was like a moment from dimly remembered, complicated dreams" (Sklar, 1967, p. 111). The psychologist reported feeling himself and observing in those around him a reverence that he identified as *satori*. He credits the imagineers with having created an *anti-bomb*, equal in technological and imaginative skill to the atomic bomb haunting everyone during this period (fantasy against anxiety). The Tiki Room displayed a Polynesian theme, a simulacrum of Tahiti. It is a confrontation of two energies, libidinal and atomic. Gauguin's misunderstanding of the relation of art and fantasy is remedied in the AI GAN (generative adversarial network), capable of generating photorealistic images from diagrammatic sketches, dubbed GauGAN by its developers (Leach, 2022). AI is becoming heuritic, as it must to democratize augmented imagination. The lesson is not (only) to admire a document of someone else's fantasy, but to explore one's own in real time. Meanwhile, we can imagine a postmodern scene: "Gauguin visits the Tiki Room."

Paul Virilio declared Disney to be more radical, more avant-garde in his productions, than the modernist painters themselves. Appreciation of his claim requires recognizing in Disney the cabaret spirit of *fumisme*, expressed in design terms through caricature and camouflage (exaggeration and deception). Disneyland as simulacrum is a caricature of Plato's *Republic*. Plato declared there are two kinds of image: copies (likeness, representation), and simulacra (appearance). Caricature as device of simulacrum produces the hyperreal, exploiting the plasmatic line to *seem more real than reality itself*, with Disneyland as the prototype of hyperreality, the dimension opened in electrated chora (Baudrillard, 1983). The paradox is that a caricature of a famous person is more recognizable than a photograph, having to do with the nature of perception and memory. This lesson has been learned by Elvis impersonators, who report that the Elvis effect requires only three gestures (lip sneer, hip swivel, rubber leg motion). Las Vegas casinos apply experience design to create Venice (The Venetien), that is more like Venice than Venice itself, according to tourist promotions. The Venetien is a simulacrum of Venice, not a representation (it is a copy for which there is no original). The theme effect is produced by providing just a few exaggerated features, accidents of flesh, enough to catalyze memory and imagination, to solicit personal disposition into participation, recognition, which is to say, to interpellate. These attunements are to digital media what logical entailment is to alphabetic writing. The little sensation is the enthymeme of electracy. The implications for solving the problem of information overload are important: *bachelor machine meets simulacrum in a game engine supporting intuition of dromosphere*. Here is an assignment for electrated AI.

Interpellation brings us back to the dialectic of danger and saving power, in noting the echo of theming in Holton's definition of the discovery side of science as *thematic*. This resonance of terms is not accidental, prompting a shorthand version of electrated pedagogy as *designing a personal theme park*. Disney carried around in his mind a vision of the park for many years before it was built. It is a modern update of a memory palace, like the one designed (but never built) by Camillo beginning in 1519 for learning all of Cicero. Personal memory theaters were a necessary feature of literate education up to the invention of print, along with commonplace books for recording a personal archive of information and topical arguments. The ground level of the theater was a familiar street, like that of one's hometown, along which were placed at regular intervals striking images (second level) associated with knowledge, the information to be memorized (third level). When students orated, they walked in imagination through this scene. Today we know that beneath this mnemonic street is not a beach (as the Situationist said), but the infant body of semiotic chora.

Mainstreet USA, entrance to Disneyland, is based on Disney's idealized recollection of Marceline, Missouri, his hometown, generalized to evoke turn of the century America. The street leads to the town square at the center of the park, a "hub" (vortex), from which radiate the four lands: Frontier, Tomorrow, Adventure, and Fantasy—past, future, nature, imaginal. Together the four scenes constitute Disney's version of the modernist catechism, and the themes are his models for answers. The park as a whole was designed by filmmakers working for Disney's studio, not architects, objectifying a kind of visit to *the other scene* created by movies. Christian Metz argued that the experience of watching movies is regressive, producing a state of potential satisfaction recalling the original transitional space of early childhood (catalyzing semiotic chora). In the TV series Disney made with the ABC network leading up to the opening of the park in 1955, narrated by Disney himself, each land is associated with specific stories,

registering Disney's personal themes. Frontierland is introduced through the life of Davy Crockett; Tomorrowland features the rocket designs of Wernher von Braun; Fantasyland by fairy tales, especially the folktales of Uncle Remus; Adventureland by "reality" adventures in nature. America emerges as tourist macro-subject in its Disneyland memory palace.

Disney's creation may function as a relay for students exploring and composing a representation of their own themata, serving as a contemporary cognitive (or conative) map. Investigating the thematic dimension of knowledge creation, Holton (1973) identified an *image of wide scope* (wide image) organizing the imaginations of those responsible for scientific revolutions. Holton identified the wide image as a pattern emerging within the *oeuvre* of innovators. The pattern was constituted by four or five images, anchored in a scene of childhood memory. When a paradigmatic theory becomes anomalous, it is replaced hypothetically during the discovery phase by the innovator's unique wide image, formatting imagination. The wide image is vehicle for the object @ (cause of desire), making it the metaphysical operator of electracy. This connection between body and design is what digital technologies natively augment. The prototype is the career of Albert Einstein, and the memory he recorded in his autobiography, of the gift of a compass from his father when Albert was four years old. The uncanny symmetry between the compass and the forces of electromagnetism makes Einstein's case paradigmatic. The wide image is just that: a vehicle and a tenor. The vehicle for Einstein is the compass; the tenor (the theme) is "invariance." The theory of relativity has been called a theory of invariance, naming Einstein's primal intuition about reality. *Vehicle*: the compass needle pointing north; *Tenor*: the speed of light. Subsequently, analysts have identified wide images in the careers of hundreds of figures across all fields of culture (Briggs, 1990).

The genre of *mystory* was created to enable students to discover and design their wide image at the beginning of their productive lives (Ulmer, 2003). *Mystory* retrieves the pedagogical tradition of memory palace from manuscript culture, to connect a primal scene of childhood experience with a disciplinary aporia. It is an investigation of interpellation, registering the position one *recognizes* emotionally (punctum) in each of the primary institutions of apparatus: family (home); mythology (entertainment); history (community); career (discipline as anagogy). The wide image diagram emerges from the topological invariances registered across the four theses. A wide image is a *fable* in Nietzsche's account, replacing the dialectic of appearance/reality (truth) with the central event of electrate learning: *the intersection of an aphorism of thought with an anecdote of life*. In this bachelor machine, external macro events allegorize individual intuitions—the disaster in me (my Anthropocene). Such is the event of theopraxis made possible online: a convergence of human faculties and their institutional projections into one holistic "world." The caveat is that the state of mind native to this virtual dimension was modeled in the first novel of modernism, *Madame Bovary*—Bovarysme (Serres, 1994).

The life of James Joyce exemplifies theming the ISA instructive for *mystory*. Joyce oriented himself in his existence (EPS) through identification with four figures. *History* (School, Community): "Young Joyce's imagination was captured by the cause of Irish freedom, whose most prominent spokesman at the time was Charles Stewart Parnell, a national hero who suffered a tragic fall. He became in the Irish imagination the type of the betrayed hero" (Litz, 1972). *Church* (Religion): Joyce's formal education took place in schools run by the Jesuit order. His most important religious experience occurred at Belvedere College, when he was elected Prefect of the Sodality, that is, "head of a group of students who banded together for the purposes of devotion and mutual help." Although Joyce broke with the Church, as Litz observed, this stance carried over to his view of the artist as secular priest. *Family* (Paleo): The defining problem of Home for Joyce was his ambivalence toward his father, whose chief interest in life was "jolification." "The inefficiency of Joyce's father and his wasteful habits gradually undermined family finances and family solidarity." *Career*: At age eighteen Joyce published a review of Ibsen's play, *When We Dead Awaken*. In a letter he sent to Ibsen, the student Joyce explained the most important reason for his admiration: "How your willful resolution to wrest the secret from life gave me heart and how in your absolute indifference to public canons of art trends and shibboleths you walked in the light of your inward heroism" (Joyce, in Litz 24).

Joyce's EPS compass: Parnell, priest, his father, Ibsen. These figures manifest Holton's *themata*, perhaps summarized in the completed sentence of Ibsen's title, expressing Joyce's own life mood: "When we dead awaken, we will see that we have never lived." Such is the epiphany structuring Joyce's best-known *Dubliners* story, "The Dead." What makes life worth living? The wide image is an epiphany relative to this question. Poetic epiphany is the syllogism of electracy. If human capability is the cause of Anthropocene, human creativity is the remedy. Students are introduced to electracy by composing a *mystory*, to discover and design their own theming of capabilities, the target of marketing but also source of creativity, perhaps to play their wide image against disaster in AI game architecture. Our best chance collectively against the Anthropocene (creativity as pharmakon), the diagrams of a coming reimaged community will have originated in the transitional objects of children.

Introduction to Artificial Intelligence and Literacy

Literacy involves knowledge and skills, which develop and deepen over time. This includes knowledge of print conventions on paper and on screen, of how characters relate to words, and of how words and other language structures relate to meaning. Full adult literacy entails some facility in applying this knowledge at a useful rate that yields accurate understanding of the intent and content of a variety of text forms—from tables and graphs, to recipes, and to extended narratives and advanced textbooks.

This article addresses some current impacts on literacy instruction that artificial intelligence is having now and some foreseeable impacts that AI can have in the future as literacy evolves. The focus here is on early literacy development in young children with no perceptual or cognitive impairments, and on instruction as practiced in school and at home in a North American context. The impacts are illustrated within a three-period timeframe: traditional practice, current AI applications in practice, and future applications and practice. Each time frame is illustrated with reference to a triad of Teacher, Student, and Student Performance. **Fig. 1** shows a simple instruction cycle within the basic triad structure.

The article does not address any recent controversies in reading pedagogy or current approaches to situate reading instruction and literacy development within social or cultural contexts. It also does not focus on the impact or amelioration of physical or cognitive disabilities that affect reading development. The assumption will be that most reading instruction has practical goals and teachers typically work with an eclectic set of resources that may be commonly at hand.

Components of reading skill

A simple theory of reading [historically associated with Charles Perfetti ([Perfetti and Hogaboam, 1975](#)) and Philip Gough ([Gough and Tunmer, 1986](#))] posits that reading skill has two main components, decoding (D) and listening comprehension (LC), and that some level of skill in both is required to achieve useful reading comprehension (RC). Decoding is the process of transforming

Fig. 1 A basic reading instruction cycle schematized within the teacher-student-performance triad.

a sequence of one or more characters into a likely phonological sequence and/or into a lexical item, that is, into a word. Listening comprehension is the process of transforming a spoken utterance, such as a conversational turn, into a likely sequence of linguistic forms (words, phrases, sentences), and with these linguistic forms, into the meanings that the speaker intended to convey. The theory is summarized in one simple equation: $RC = D \times LC$.

Because the operation between D and LC is multiplication, if either D or LC is equal to zero, then RC will also be zero. A more general term that subsumes decoding is Word Recognition. Word recognition includes decoding, as such, along with direct apprehension of word forms, known as sight-word recognition. Both components are needed for reading, and each of the two main components of reading skill in turn has several components, listed below for convenience.

- Word Recognition: knowledge of (alphabet, letter-to-sound relations, alphabetic and non-alphabetic conventions, affixes and their conventional spelling rules, etc.).
- Listening Comprehension: knowledge of (sound-to-lexical map, phrase structure, semantics, rhetorical conventions, etc.)

Spoken and written language vs. formal/informal

Learning to understand speech is never an issue as it is for written language. Conceivably our evolutionary history of spoken language relative to written language is responsible for this difference (Merlin, 1991; Pinker, 2007). Writing was originally met with some skepticism from early philosophers who thought that our humanity was compromised because memory was less essential with writing than with speech.

Table 1 illustrates examples of communication media in which the formality of the language and its modality can be categorized independently of one another. Although we usually think of informal spoken language and formal written language, a TED talk is formal and spoken whereas texting is informal and written. For example, the formal nature of picture books allows the writer to make more deliberate word and grammatical choices that are not always feasible in child-directed speech (CDS). CDS and adult-directed speech (ADS) requires a spontaneity (Grice, 1975) that necessarily limits word choice and allows deixis to substitute for various words and grammatical constructions.

Artificial Intelligence (AI) delineated

Note that machine learning (ML) is different from AI, and we can consider how the two relate to reading. Note that both ML and AI are relatively recent terms, so their meanings are still in flux. Briefly put:

AI refers to automated actions that seem appropriate to biological intelligence;

Table 1 Gives a taxonomy of the potential independence of language modality and formal (non-conversational) versus informal (conversational) dialog.

	<i>Spoken</i>	<i>Written</i>
Formal	TED talks, lectures, MOOCs	Books, articles Newspapers
Informal	Conversations, interviews TV media dialogs	Texting, messaging Email

ML is an engineering field that develops technology to build AI systems.

ML refers to algorithmic processes that operate on data sets to produce algorithms that cluster, classify, or identify patterns in new (unseen) data sets. Typically, an algorithm infers a function (or a model) that assigns labels to new data from an analysis of labeled training data. For example, thousands of transcribed voice recordings are analyzed by an ML procedure, which produces an algorithm that transcribes new voice recordings.

Artificial Intelligence (AI) is an ability of automated systems to perform tasks that until recently required human or other biological information processing, often including signal analysis, decision, and sometimes, verbal and/or mechanical response. People think of AI as the use of automated systems that perform tasks which traditionally have required human, or at least vertebrate, intelligence. For example, cars were designed to be driven by people, but now can drive themselves as well as an average human driver. As we delve into AI and reading, note that self-driving cars are possible in part because many millions of miles of car travel (on the road with multiple sensors) have been logged and analyzed with machine learning algorithms. Obtaining and analyzing large databases for machine learning has been essential in autonomous vehicle development, as in other domains. Thus, we expect that large databases will be necessary for the development of AI applications in reading too.

Traditional, current, future approaches to reading instruction

The remainder of this article is divided into three sections:

- Traditional reading instruction,
- Current reading instruction as augmented with AI tools/applications, and
- Future reading instruction, including future literacy practices more generally.

The first section is a brief overview that may help a reader locate the needs that current AI tools and applications address and the benefits that accrue from these. In the second section, we learn that most of the current AI tools do not disrupt the flow of reading instruction. Instead, they facilitate current practice and render it more fun, more efficient, more accurate, or more effective. AI may radically change the future of reading and reading instruction altogether. The last section describes a few current research initiatives that may further improve current instructional practice and a foreseeable future in which AI capabilities that are likely to change the nature of information access generally and change the nature of reading development and instruction along the way.

Traditional reading instruction

Pre-digital reading instruction

In the United States, between 2000 and 2020, reading instruction in schools largely followed patterns that were informed by a model of reading that was set forth in a report from the NICHD (2000), which [Tim Shanahan \(2006\)](#) usefully summarized in 2006, setting out a rough set of five main layers of skill/instruction that support successful reading. These five layers are shown in [Fig. 2](#).

We will assume that students have sufficient phonemic awareness to start learning to read. First comes the establishment of print awareness skills—the student can recognize and name all the lower- and uppercase letters and say what their most common sound value is. Then, students are introduced to the most common sight words (e.g., the, in, can, no, how), and to the basics of phonics, or letter-sound correspondences, going beyond the most common sound value for each letter. These foundational skills are usually established before the “Instruction Loop” shown in [Fig. 3](#) gets started.

When the instruction loop starts, teachers direct students to read from leveled text material—starting with very simple materials that have a picture and only a few words or a short sentence per page. The teacher then informally, monitors the literacy

Fig. 2 Five elements of reading.

Fig. 3 A fuller version of a typical reading instruction cycle in grades 1–3, the dashed line shows an added path for students who are identified as struggling readers. Two static resources are shown: leveled text and diagnostic materials.

development of each student by observing as the student performs in a variety of tasks that may include reading aloud, writing, understanding texts, and sometimes in periodic formal benchmark tests that may be required of all students. As time goes by, if students perform at about the level expected for their age and grade, teachers gradually increase the difficulty of the leveled text material that students read, and the instruction loop continues, perhaps over 3–5 years, until students can read efficiently enough to understand and enjoy age-appropriate stories and books, and can independently read grade-appropriate academic text to learn new material.

However, for struggling readers who perform below expectation on benchmark tests, who are not performing at grade level, or who simply lag behind the rest of the class, a teacher or a reading specialist may administer a set of formal tests and score an individual student's reading performance. Diagnostic analysis of the individual test performance helps determine which, if any, of the component reading skills may be hindering the student's reading development. A teacher or reading specialist will then select suitable materials and give them to the struggling student with directions and encouragement, as needed.

Given reasonable curriculum materials and sufficient time with a qualified teacher over a 3- or 4-year period, most young readers will emerge with basic literacy skills and a solid foundation for gaining broader and deeper literacy with the practice they encounter in late elementary and middle school (grades 5–9, or ages 9–13 years). By the end of 12th grade (age 17–18), after many hours of reading in the instruction loop and then across the curriculum and in life outside school, many skilled readers can comprehend text at a rate of 200 words per minute or more (*Average Reading Speed, 2022*). This is faster than the rate of most spoken language they encounter. The next section reviews (2021) AI applications that extend the range or the nature of literacy instruction, improve the efficiency of reading development, or improve accuracy in measuring reading and literacy-related skills.

Current AI tools applied in current contexts

The extended mind (& AI-in-loop, human-in-loop)

Artificial intelligence (AI) is performed by machines, but it usually involves a human participant. Some applications of artificial intelligence can be viewed as contributing to the extended mind (*Clark and Chalmers, 1998*), which involves the situational milieu we inhabit. We now take for granted that many AI tools and apps facilitate a variety of human cognitive processes, as they become more accurate and commonplace. In the period 2000–2020, several technologies have off-loaded complex cognitive demands, including, complex information retrieval, text-to-speech synthesis, automatic speech recognition (ASR), and automatic language translation.

When early text-to-speech (TtS) synthesizers were first commercialized in the late 1970s, they were crude but sufficiently intelligible for successful commercial application in reading machines for the blind (*Klatt, 1987; History of TtS, 2022; van Santen et al., 1997*). By 40 years later, TtS systems had achieved wide acceptance in many applications as the systems evolved to emit highly intelligible and much more natural sounding speech. Speech synthesis is still viewed as an AI technology, and two core components of TtS are products of machine learning: first, the text-analysis methods for word disambiguation and for construction of prosody; and then the augmented ASR technology that finds optimal sequences of signal snippets to concatenate for clear and natural sounding words.

Going back further, the invention of visual symbols and print changed what was possible and might be considered an early instance of AI for language and communication of information. The magic of making physical marks that could be seen at a future time by others enabled communication in a manner previously impossible—it allowed one person to communicate to another person across time. Writing preceded the recording of spoken language and it leaves out some of the collateral information in

spoken language, such as personal identity and voice-borne expression of emotion. On the other hand, written medium also enabled important representations of information such as tables and graphs that are not easily understood in their spoken form.

Viewing AI as an elaboration of the extended mind might put AI in a more acceptable framework in that it is then a product of the human mind that has the human mind as an essential partner in various applications. As Neil Stephenson, the legendary science fiction writer has stated, “Ideally we ask AI to function as an aid or assistant in our journey toward knowledge” ([Michael Shermer interview, 2021](#)). This framework doesn’t eliminate the recent fearful premonitions of runaway AI but perhaps puts them in a better light.

Technology aided assessment

Given that live teacher time is limited, robots (and we believe virtual tutors) can substitute for the teacher just as effectively if not more effectively. Our ideal virtual tutor would have assessment built into the tutoring regimen, and the goal is to have the student as engaged with the testing as she is with the reading and mentoring itself. Engagement of a virtual agent or a physical robot has been studied in a variety of learning contexts, but not systematically in reading and learning to read. Although lacking in systematic reading contexts, there are helpful findings on refining measures of students’ engagement, how various verbal and nonverbals cues from the agent are picked up, and how engagement can fluctuate during the interaction. If researchers and teachers explore virtual or robot mentors for reading instruction, there is a wealth of guidelines in the literature ([Belpaeme et al., 2018](#)).

Students don’t necessarily enjoy being tested particularly if they are somewhat unskilled, as most learners by definition are. Furthermore, it’s been found that in simple multiple-choice tasks in which a student selects one response from multiple options, many students respond so quickly that they could not have completely understood the question and the gallery of answers. One answer to this challenge has been proposed: the Technology Enhanced Item or TEI ([Bryant, 2017](#); [TEIs, 2021](#)), with creative testing formats. An example of a TEI might ask the student to highlight the relevant text in answering a question. In a very large systematic study, TEIs have shown the lowest rapid guessing rate, which traditionally reflects lack of student engagement: 10 times more often on multiple choice items than on TEIs.

Electronic tutoring systems endorse intelligent programming to create innovative formats in the testing environment. A student might be asked to drag and drop content from a text to answer the question. Another possibility would be to highlight the text or select multiple items from the text. In this sense TEIs offer the promise that students can be kept engaged in a reading environment even though assessment is part of that reading environment. Given that there is strong evidence that TEIs improve engagement, we can push the envelope even further by requiring more sophisticated interactions from the students such as open-ended answers or having the student actually perform a simulation or instructing the virtual mentor to perform a simulation. Ideally, an engaging tutoring session in reading would blur any existing boundaries between learning and assessment.

One challenge in applying social robots to develop reading skills and to include intermittent testing is to maintain the student’s engagement with the tutor. There is some indication that students’ interest diminishes when the novelty effect evaporates. One key to maintaining interest is to establish a meaningful relationship between the student and the tutor, and to reinforce the student’s memory of this relationship ([Kasap and Magnenat-Thalmann, 2012](#)). Using RoboTutor, [Boote et al. \(2021\)](#) tracked the tutee’s face to monitor engagement, and the partially successful goal of predicting whether the student would complete one of the exercises. This offers one source of information among many others such as properties of the voice, response latencies, and accuracy in the task that could increase the effectiveness of monitoring engagement. Interestingly, they were able to define an early bailout when the child didn’t like the activity and a later bailout which occurred during the interactions with the tutor. This distinction is a valuable one because different types of intervention would be necessary for success.

Automating Oral Reading Fluency (ORF) assessment

Periodic assessment of reading performance is important for guiding instruction, but a recurring problem is that students spend too much time in testing, and teachers spend too much time on activities that surround testing—in-service training, administering and scoring tests, and then interpreting results ([Bernstein et al., 2017](#)). Thus, automatic systems to administer and score ORF performances have gained acceptance and proliferated in the period from about 2015 to 2022 and onward. This has been accomplished with student-friendly online presentation of material in a browser, which is combined with AI capabilities on servers in the cloud.

The server-side AI comprises child-appropriate ASR and automatic scoring and scaling of the recorded read-aloud responses. Such systems can now (2021) return accurate ORF scores and running records of a student’s performance within one second after test completion. The most salient advantages of current automated ORF tests are their convenience and reliability. They are convenient for the student, because the tests can be self-administered at the student’s convenience, and an automated ORF test may occupy less student time. Such tests are more reliable in that they apply acceptance and scoring rules quite consistently, and they score readers without favoritism toward individual readers or groups. Automated ORF measurement has also been shown to be indifferent to irrelevant dialect differences and reading pronunciations of readings by speakers of English as a second language ([Balogh et al., 2012](#); [Bernstein et al., 2017](#)).

A key disadvantage in current automated testing and scoring is the absence of real-time system-initiated interaction with the student during the test administration. Such interactions from the system might include interruptions to encourage or give guidance, or simply to present the test-texts at a more appropriate level so they are within the student’s zone of proximal development.

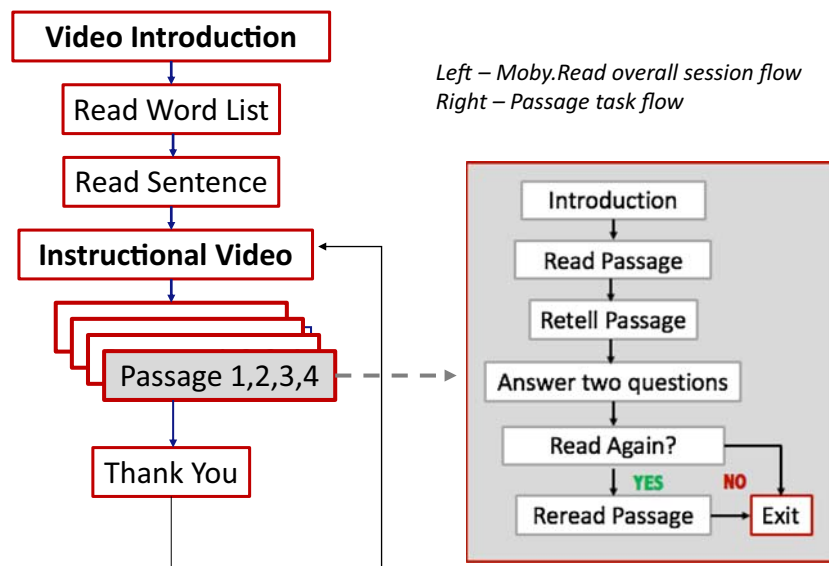

Fig. 4 Session and passage presentation flow for each passage (1 practice, 3 scored) in Moby.Read.

Moby.Read: an automated ORF test

The *Moby.Read*TM (2022) system is a fully automated and self-administered oral reading fluency (ORF) benchmark assessment designed and built in 2016–18 and introduced commercially in January 2019. *Moby.Read* is designed for benchmarking early reading performance three times a year. Inside the *Moby.Read* system, an ASR was optimized for children’s readings and their spontaneous speech in retelling text passages, and an augmented natural language processing (NLP) module enables immediate score reporting of five key oral reading fluency skills:

1. Reading Level,
2. Accuracy,
3. Accurate Reading Rate (in Words Correct Per Minute),
4. Comprehension, and
5. Expression.

During the assessment, as shown in *Fig. 4*, students read four passages aloud, summarize the passage content, and respond to short-answer questions using their own voice. *Moby.Read* embeds model readings and opportunities for students to “go back” and re-read a passage to hone their oral reading skills (see *Fig. 4*). An assessment takes about 12 min and runs in Chrome or as a native app on iPads.

Scores are available immediately so teachers can apply the most current possible information to individualize reading instruction. Additionally, audio recordings allow teachers to diagnose performance issues and to share them with reading specialists, parents, and with the students themselves (see *Fig. 3*). *Fig. 5* gives a sample presentation flow for each passage (1 practice, 3 scored) in *Moby.Read*.

Automated tutoring

Once interactive screen time became feasible, various commercial and school curricula of speech and reading tutoring were implemented in electronic exercises in speech, phonics, and vocabulary (*Phonics Exercises*, 2022). These involved very little AI other than utilizing speech and graphics within a given instructional-game design. Typically, children learn the alphabet and then how to sound out various spelling patterns. This method isn’t foolproof, however, as experienced by a grandmother with her grandchild sounding out a word written under a picture of an insect. The child expertly sounded out bug for the word but the word was actually *ant*. Another method has children spell various sounds. One commercial game reinforcing the sound of speech is *iSPY* in which the child is given a sound and matches words that begin with that sound (*iSPYPhonics Fun*, 2021).

Although most early reading instruction is grounded in phonics, a case can be made for increasing the beginning reader’s awareness of the language’s orthography. It seems reasonable that drill and practice in phonics also heightens a child’s awareness of these spelling patterns to facilitate letter and word recognition during reading. There is evidence that expert readers and children learning to read use spelling constraints to more easily identify letter patterns and words (*Venezky and Massaro*, 1979, 1987; *Massaro and Hestand*, 1983).

Fig. 5 A sample presentation flow for each passage (1 practice, 3 scored) in Moby.Read.

Phonics with Baldi

Given dramatic progress in creating a rich sensory world in educational domains, it is surprising that most current decoding exercises do not exploit multiple modalities. Given that seeing the speaker's face can contribute significantly to understanding and learning language (Massaro, 1998), and developments in computer animation of talking heads, it is now feasible to carry out phonics instruction and assessment bimodally. Various characteristics of the vocal tract can also be viewed from different perspectives, which might help the child (or second language learner) master the phonics and spelling of the language being learned.

The 3D computer-animated talking person, Baldi, was developed to produce accurate visible speech (Massaro et al., 2005; Baldi Tutoring, 2022a). Using this technology, a game was developed called Phonics with Baldi. This involves a matching game in which the child is required to match the animated pronunciation of a sound with a possible spelling. In the matching game, a successful match is rewarded by eliminating the matching pair from the display. The goal of the child is to complete all of the matches and move on to higher levels.

Read With Me!

Picture books are a foundation for a child's inauguration into a literate world (Gurdon, 2019). Although seldom put to rigorous experimental tests, they appear to be a prevailing influence on children's cognitive and linguistic development. Content analysis of picture books and child directed speech (CDS) documents that the linguistic and cognitive sophistication of picture books far exceeds that found in CDS (Massaro, 2015, 2017; Montag et al., 2015; Williams et al., 2022). Although electronic TV media consume more of the child's time, picture books best demonstrate to the child that a static medium can elicit language and ideas that can engage their attention. The caregiver-child dyad appears to be a prominent characteristic of the impact of reading these books to engage children.

What might be surprising is that this shared picture book reading contributes very little to a child's acquisition of the mechanics of reading (Massaro, 2012, 2017). By this we mean phonics, letter recognition, and written word recognition. Children do learn that books contain words and stories (or at least stories) that can transport them to another place and time. However, picture books aren't designed to highlight written language but rather primarily illustrate in pictures the story being told. Because of the emphasis on pictures, the print is often either considered unimportant or embellished to look less like print and more like picture design. The design of picture books encourages children to focus on the pictures rather than the words in shared reading-aloud situations (Evans and Saint-Aubin, 2013). Perceiving words requires focused viewing of the words. The print in most children's picture books is not

usually appropriate for a child learning the mechanics of reading (There is also some evidence, however, that children can learn some reading mechanics with picture books that emphasize the legibility of print, [Massaro, 2017](#); [Piasta et al., 2012](#)).

We might ask how AI can be utilized to complement the shared reading experience of picture books in order to reinforce reading mechanics. To promote learning the mechanics of reading during shared picture book reading, Dom Massaro created an Apple iPad app called *Read With Me!* (2022). At various times during shared reading, the adult reader can choose to display some text from the physical book in clear font on the iPad (*Read With Me! Demo, 2022*).

To use the app, the caregiver and the child choose one of their favorite books from the app's library. The caregiver reads the book to the child, both of them enjoying the rich sharing of emotion and adventure. *Read With Me!* adds to this experience by allowing the adult reader to dictate a sentence from the book to initiate the presentation of this sentence on the iPad screen. The app uses a robust method of ASR because it knows which book is being read.

The application allows the caregiver and child to share attention between the picture book and the text presented on the iPad. The child should have a good view of the screen when the dictated sentence is present. The iPad can be held by the caregiver, placed on a table, or placed inside a transparent holder sewn into a shirt that the caregiver would wear (*Read With Me! Demo, 2022*). This experience allows the child to experience written language in the manner that they experience spoken language. The *Read With Me!* app adds print without requiring the caregiver to provide explicit instruction in prereading skills. Many caregivers tend to have limited knowledge of or motivation to teach appropriate literacy skills. It remains to be tested whether this app or similar ones can help bootstrap a child's reading in the same manner that the speech toddlers hear aids spoken language acquisition.

Understand My World

Ideally, we would embrace an AI tutor reinforcing the mechanics of reading while simultaneously the child is primarily engaged in new and active learning. Using advances in AI, one example app, *Understand My World* (2022), immerses learners in spoken and written language as they are learning about their world. Equipped with a camera, microphone, and an internet connection, the student has direct access to unlimited information. Images captured by the camera are labeled and can be defined in both speech and writing. Participants can also speak and record their speech or ask questions. The app then presents the dictated words or answers to questions in either written or both spoken and written form. Some example questions are "Tell me about Sesame Street." "Who is Ben Stiller?" "How many miles in 7 km?"

Because evaluation is central to language interventions, the app records a history of the student's interactions with all three functionalities. This history can be utilized in several ways, such as recording time on task, the vocabulary encountered, the student's speech, and the content of the student's interactions. One possible evaluation, for example, would be to compare the student's mastery of the content experienced within the app to comparable content the student experienced outside the app.

Reading practice

Jack Mostow and colleagues, situated within a campus with a premier speech science department, developed a computer program that uses speech recognition to listen to children read. Beginning roughly 3 decades ago, their core technology was ASR, well before it evolved to have the quality it has today ([Mostow, 2013](#); *Project LISTEN's Reading Tutor, 2022*). The goal was to use ASR to listen to children read and guide each student individually in oral reading. Their reading tutor proved successful in a number of independent studies when compared to independent reading practice and even tutoring by certified teachers ([Mostow, 2013](#)). Dependent measures included word identification, oral reading fluency, and comprehension.

More recently, a number of reading tutors have been deployed. Reading with companion robots will definitely become more commonplace, with their prices within the range of other appliances such as TVs. In one representative study ([Sauppé and Mutlu, 2014, 2015](#)), a reading companion/mentor robot, Minnie, interacted with children during the child's reading. Minnie was not programmed with the latest speech technology as in applications assessing oral reading fluency but she did make book suggestions, guided and monitored the child's reading goals, and made comments to support their understanding and interest in reading and science. In the near future, we expect assessment and instruction to be embedded in tutoring interactions. Given Minnie's portability, she could provide time on task for reading at home as well as in school. Based on their pilot studies ([Sauppé and Mutlu, 2014, 2015](#)), children appeared to make a strong social connection with Minnie, which agrees with findings in other domains. We found this to be true of Baldi, an animated tutor, for both hard of hearing and children on the spectrum ([Massaro, 1995](#)).

Research foundations for future AI

Electronic databases

Some of the major achievements of AI are critically dependent on acquiring and analyzing electronic information. We all know how the internet has consolidated many unfathomable sources spanning the spectrum of knowledge. Students and professionals alike can easily access Wikipedia and other websites to find the latest state of knowledge in almost any domain. The AI programming to make this information efficiently retrievable and useable has led to impressive intelligent AI systems such as IBM's Watson, which was able to beat the champion Ken Jennings in a Jeopardy competition (*Jeopardy, 2022*).

AI's intelligence has increased exponentially in effectiveness hand-in-hand with computer's speed and memory. Data mining recording and analyzing linguistic content has also grown exponentially. We've learned that the amount and quality of language children experience is central to the path to literacy ([Hart and Risley, 1995](#)). This observation has motivated researchers to

determine important academic words to use in schooling (at perhaps the expense of non-essential words, acknowledging that time-on task is limited).

Children are talked to, read to, and in many cases watch TV Media. Different estimates of the amount of input 2–5-year-old children experience from these three different contexts are roughly 150 min for both CDS and TV Media, and only about 15 min of parents reading (picture books) to their children (Media, 2022). Massaro (2015; unpublished) analyzed potential vocabulary and grammar differences in these three linguistic environments. Content from each of these three media were analyzed to record their vocabulary and the reading level. To determine vocabulary differences among the three media, the three samples were assessed against two independent measures of frequently used spoken and written words (Brysbaert and New, 2009; COCA, 1990–2012; SUBTLEX, 2021). Children experienced over twice as many rare word types with picture books than with the other two media (Massaro, 2015; Williams et al., 2022).

The formal nature of picture books allows the writer to make more deliberate word and grammatical choices that are not always feasible in CDS and written in TV scripts. As mentioned previously, the spontaneous nature of conversational speech constrains word and grammar selections and encourages use of gesture and deixis. Using Hiebert's (2005) list of academic words, these rare words actually corresponded to important words for schooling. Picture books had about 2 or 3 times the number of these academic words than did Parent Speech and TV Media. Examples of academic words found in the Picture Book database but not in the other two media are *centers*, *heated*, *lowering*, and *winding*.

Words are also more valuable for schooling if they have high dispersion, that is, found in different content areas. Picture Books provided about twice as many high dispersion words relative to the other two media. Examples of words with a high dispersion value in picture books that did not occur in CDS and TV Media were *behave*, *circulation*, *exchange*, *intricate*, *strain*, and *switch*. Using data mining, we learned that picture book reading provides valuable vocabulary for future schooling.

Mining databases to optimize reading complexity

Paving the road to literacy would ideally have linguistic and cognitive complexity of spoken language that is representative of material that the child will be reading in school. We expect that more complexity would be valuable. Grade level readability measures (Readability Formulas, 2021) were used to determine the reading grade level of the three media just discussed, as well as ADS. Children's picture books had a higher reading grade level than CDS and TV Media, as well as ADS. The data mining revealed that reading picture books to children is beneficial, as it appears to familiarize them with more challenging language and a more extensive vocabulary than they would otherwise encounter (e.g., van Kleeck et al., 2003).

Mentoring by social robots

A robot track man that calls balls and strikes in baseball more accurately than human experts is a prototypical instance of artificial intelligence (AI Umpire, 2022). It mimics intelligence of humans but in this situation also does it better. It picks up information from the trajectory and location of the ball and computes if each pitch is in the strike zone. Given high-quality sensors and a simple AI algorithm, an accurate call is assured, significantly better than a live umpire.

Imagine a child learning to read with a personalized robot companion with knowledge of the child's reading level, including vocabulary and grammar, and general knowledge. In addition, the robot will have goals including one to advance the child's literacy, and will continuously learn about the child and the appropriate tutoring required to achieve the goals. With this knowledge, the robot can then anticipate where the child could be tripped up by the text and could modify and even embellish it appropriately to make it compatible with the understanding of the child. In this case, the robot would provide the affordances necessary for acquired literacy. This would also exploit the zone of proximal development described by Vygotsky (2022).

Two exploratory studies provide some incentive to determine whether social robots are facile enough to encourage and aid a child at various levels of reading skill, such as phonics, vocabulary learning, and fluent reading aloud. Michaelis and Mutlu (2018) found that a social robot engaged early adolescent children in a variety of guided reading activities. The children claimed that the robot helped with comprehension and provided them with motivation to read. Yueh et al. (2020) used a social Robot Julia to facilitate library literacy activities with elementary school children.

There has been a plethora of studies evaluating the effectiveness of robots as tutors in a variety of domains other than reading instruction and assessment (Belpaeme et al., 2018). According to a Belpaeme et al. meta-analysis of hundreds of studies, tutoring robots have been cognitively and affectively effective in many different domains. Initially, there seemed to be an advantage to having physically-present robot tutors in place of virtual tutors on a screen. A meta-analysis of 33 experimental studies found that "a co-present robot to be more persuasive, receive more attention, and be perceived more positively than a virtual simulation of the agent being tele-present" (e.g., presented on a screen, Li, 2015). However, there is also more recent evidence that virtual tutors can be just as persuasive as co-present tutors (Deng et al., 2019).

Although it is not certain that any difference between virtual and physically present tutors would occur with a reading tutor, it would be more practical and less costly to program tutors on screens than to provide every child with a physically present robot (Deng et al., 2019; Li, 2015). Students might also demand that their robot be unique in both physical and psychological characteristics. Advances in Augmented and Virtual Reality might diminish this gap between physically-present and on-screen social robots so that it would be more feasible for each student to have a personalized robot. On the other hand, we might learn that something

like physical presence is important, perhaps a carryover from the child sharing picture books with loved ones. The final word about virtual tutors and co-presence has yet to be uttered or written but their destiny will have a role in reinforcing literacy.

Although this review covered normative reading instruction and practice, it is worth mentioning that robotic tutors should have even greater potential for children with challenges such as hearing loss or existing on the autism spectrum. Baldi, introduced earlier, proved a successful tutor for both these groups of children. One major advantage of Baldi, like any robot, is his availability 24/7 and programmed extreme patience and encouragement. In one-on-one tutorials, both populations of children learned and retained new vocabulary and grammar. Children on the spectrum, who tended not to look at faces, also learned to perceive visible speech more accurately. Using a within-subject design, the research also convincingly showed that Baldi's intervention was responsible and not some other explanation such as time on task. Demonstrations of children in the tutoring situation are available ([Baldi Tutoring, 2022b](#)).

Predicting the future

While developing Baldi, a computer animated talking head, to provide accurate visible as well as audible spoken language, showing it was effective in communicating spoken language, and applying it to situations in language learning ([Massaro et al., 2005](#)), [Massaro \(1995\)](#) wrote a science fiction scenario on a future without written language. English had become the world's dominant language and societies could no longer afford to continue English literacy. Literacy learners had difficulty conquering the irregularity of English's spelling, with many inconsistencies between spoken words and their spelling. A popular example is that it would be acceptable to spell fish as ghoti (gh as /f/ in tough, o as /I/ in women, and ti as /s/ in nation). Critiques and revisions of English writing have been advocated by illustrious celebrities including George Bernard Shaw and Mark Twain ([English Spelling, 2022](#)).

As with most antecedents of change, there were other factors leading to literacy's demise. Having overpopulated the earth with diminished raw materials, it was convenient to use existing books as insulation for high density housing. Most importantly, however, was the technological development of computer-animated characters with realistic speech and language. Although Face Time, audible books, and podcasts were not yet on the horizon, the prediction was that communication was primarily spoken whether between live participants or with animated characters.

Traveling from this 30-year-old prediction of the future to today, written language might still be in jeopardy. English no longer has to be the dominant language, so English will no longer be necessary for successfully navigating the international world. Huge increases in computational power and wireless communication with small portable devices, efficient algorithms in speech synthesis, spoken language recognition, and language translation are currently available for many languages and many more around the corner (Google Read Along is currently available in 180 countries and supports 9 languages). Given this technology, real-time translation will allow access to any language, so one only requires their family's language learned from birth.

Spoken language might again gain prominence after just a few centuries of text dominance since the invention of the printing press. Being lost in a book or going to that special place with text may have a shorter lifespan than currently anticipated. As observed by Farhad Manjoo, "Yet there are just as many books that achieve a resonance via the spoken word that their text alone cannot fully deliver" ([Manjoo, 2021](#)). The narrator can add life to the writing and capture what [Jaynes \(1976\)](#) described as the voice capturing, or even kidnapping the listener's attention. As technology advances, the audio book will continue to be embellished creating sound effects, surround sound, and features yet to be imagined. For memoirs, your favorite celebrities, and stand-up comedians, the likely choice would be to listen (and perhaps watch if possible). In 2019, almost one in four Americans listened to an audiobook in the previous year, only slightly less than the number who read an electronic book ([Reading or Listening to Books, 2022](#)). In his dystopian novel of the future, not anticipating advances in speech technology. Neal Stephenson's *Diamond Age* (1995) found an essential role for live narrators of texts (called ractors) in contrast to the many technological advances in his multiverse.

For many of us, an illiterate society is a sobering thought. There must exist convincing reasons that written language has a role to play in the future. As one possible reason would be efficiency: we read at least twice the rate as we utter and hear spoken language. But many of us have already learned that various audio and video applications have options to speed up (or slow down) the play-back rate. Text-to-speech can be easily understood at much faster than normal, rates comparable to skilled silent reading. Podcasts (now in the millions) might be predicting the future. Yes, texting is pervasive but many texters use speech recognition to send these messages, and speech could be used to understand them. We can expect to have a technology translating adumbrated texts to coherent speech, ensuring spoken language its dominance. We think of text demanding much less memory storage but given advances in spoken language technology, the electronic footprint of text to speech can be reduced to be more similar to text.

Understanding tables, graphs and equations will demand some written form. As [Manjoo \(2021\)](#) observed, "I have also had trouble listening to dense, especially technical books." Written language won't disappear but for many, spoken communication will be preferred. We might fall back on print when the material is dense and complex, and simply to take a break from a voice that may be commanding more obedience than we are willing to fork over. But we predict the voice (even if it is synthetic) will carry the day. We know also that the real voice coming from the body will have a game-winning advantage, conveying emotion from multiple sensors including heart rate, sweat glands, and facial expressions that are lost in print. The voice will have a multimodal advantage, when it is in YouTube video guides of information to solve the most esoteric challenge. With one giant leap beyond virtual and augmented displays, an AI implant will connect us with what we need now because it is in constant communication with our own hardware. We are, however, humble in knowing how many predictions go awry.

Our private reading might be preempted by listening, but we won't want to sacrifice reading aloud to our children. This became particularly poignant when we observed the richer language our preschoolers experience in picture books relative to CDS and TV Media (Massaro, 2015; Williams et al., 2022). To preserve this tradition, the pictures in picture books can exist as they do now or they can be presented on screens. Since it is unlikely that we will memorize the many stories, the caregiver could listen along with the child or would have to somehow shadow the audio book while reading it to the child. But the caregivers could listen along with the child, embellishing the story in a variety of ways as they see appropriate. Thus, although listened to rather than read, picture books will continue to enrich our toddlers' brain with the richness of formal language.

A potential danger is that dominance of spoken language might lower the quality of our stories. That is, we know writing is mostly rewriting following Nabokov's prescription that reading is re-reading and this dictum might fail to impress the spoken language storyteller that scripting is re-scripting. Books will not have the formal language we value if the author doesn't have the opportunity to embellish and revise their drafts. With the expected advancement of controls over spoken language, the author could choose to stick with the spoken medium (especially if she is illiterate). The first generation experiencing the impending demise of written language will stick with writing even though the majority of "readers" will be listeners.

Sudowriters

After cautioning storytellers about AI's impending demise of written language, it might seem ironic to question whether AI could aid in our storytelling. To sample what AI might contribute, we input our initial first draft sentence in a just discovered AI writing application [Sudowrite \(2022\)](#).

The intersection of Artificial Intelligence (AI) and Literacy should certainly be a show stopper for the casual reader.

Sudowrite is powered by (and we mean powered by) a supercomputer with 285,000 processors to learn from the existing multi-verse of content using, of course, a multilayered neural network. Given a single topic sentence, it spits out some additional text corresponding to a variety of genres that include our senses and various metaphoric domains. Here's what we were able to select from Sudowrite's output delivered more or less instantaneously to our seedling first sentence.

One of the most advanced pieces of technology in existence, artificial intelligence has evolved to reach comprehension for both spoken and written language. It is now able to understand simple questions, like "what is the definition of the word 'cat'?", and can tell you what it is, or anything else you'd ask of it.

This technology is still in its infancy, but artificial intelligence is quickly improving. More and more, it's becoming more engrained into our daily lives.

The AI's purpose is to read things, but it is not a physical piece of machinery. Despite being made of machinery, it has no physical form.

The concept of Artificial Intelligence is that, if you have enough information, you can teach it to learn. Eventually, you will have an intelligence that is more sophisticated than humans. At the moment, artificial intelligence is still in its infancy, but it's quickly becoming more common.

Although the program expects multiple iterations of feeding each output back to Sudowrite, we stopped here. Our gracefully extended deadline became hard and it was somewhat eerie to include Sudowrite as a co-author.

Challenges to AI's role in literacy

Limitations in embodying us

Should we expect a social robot to embody all of the unique characteristics of live tutors anytime soon? Some are optimistic that this goal is within reach (Kurzweil, 2021), whereas others resound a strong negation (Moore, 2016). Linguistic exchanges create a milieu of anxiety shared by both parties, and we are uncertain how to embody this characteristic into robots (Rowe, 2020). Reducing this anxiety during exchanges in conversations and even narratives is married to rewards. A non-linguistic example involves the little hit of dopamine that the infant receives when she wiggles her foot to jiggle the overhead happy birds mobile. Similarly, an interlocutor thrives on resolving uncertainty in the conversational exchange (Ramscar and Port, 2015, 2016).

However, we can expect that an artificial tutor who only approximates embodiment of a human tutor to be effective in guiding the child or student to learn both language and new knowledge. Can an AI companion ever achieve the linguistic and cognitive

capacities that humans find so natural? Christiansen and Chater (2022) make a strong case that humans are unique in pursuing an iterative language game in which utterances take on meaning whereas AI systems are nothing more than mindless fact-collecting automata that don't have an inkling of what's up. Moore (2016) argues that improvements in speech (and animation/robotics) technologies can outpace a social robot's cognitive and linguistic capacities. This "uncanny valley" would dismantle productive interactions because participants would overestimate the social robot's capability. Humans are fairly robust interlocutors, however, and we might be well-equipped to converse productively with unequal partners. Real life successful examples include interlocutors with language and cultural differences, as well as children, chimpanzees, and dogs. Children are also successful in conversations with single word utterances (Herr-Israel and McCune, 2011; Massaro, 2020). The infamous chimpanzee Nim convinced his caregivers that they were productively conversing even while they were implicitly cuing him for appropriate replies (Massaro, 2020).

Although we are both predicting the future, one of us might actually be correct. As evidence for his pessimism, Moore in 2016 claimed that intelligent assistants, such as Siri, were not very popular but the demographics have changed significantly—another instance in which it is difficult to predict the future. As we write this, Siri receives about a billion questions a week; in 2016 Alexa had only 130 interactive skills but now the number is well above 100,000; Google's Home assistant is also popular and of course many people google search by voice and often receive voice replies or links to spoken and video answers. It's expected that over half of the US households have or will soon have smart devices that allow human-machine dialogs via voice. We might also expect that these devices will become more embodied, with virtual agents or even a physical robotic presence such as the intriguing applications of Furhat (2021).

We can expect that virtual tutors rather than physically-present robots would be prevalent because sensory motor interactions are much easier to program virtually than in actual physical substance. Successful interactions between humans and machines have certainly increased dramatically in the last few years, with no sign of diminishing. We find it more than natural to address Siri or Alexa with a plethora of questions, for example. Also, there is active research and applications extending human-robot interactions to be embodied (Furhat, 2021). As social robots incorporate multisensory perception and action, we can expect much more rewarding dialogs and outcomes.

Retrospective

Artificial Intelligence and Literacy is expected to continue to provide a synergistic partnership in both reading instruction, reading, and access to written sources spanning the range of human knowledge. Improved machine learning algorithms, technical advances, and computational speed and efficiency are responsible for these impressive developments. Surprisingly for one of the authors was the realization that speech science was the primary AI contributing to this progress. Cognitive Science tended to partition research in separate speech and reading bins, and most research adhered to this separation. Much earlier, St. Augustine might have noticed the tight relationship between spoken and written language when he was surprised observing his mentor, St. Ambrose, reading silently without moving his lips (Manguel, 1996). Bochner and Bochner (2009) make a strong case against print alone accessing, acquiring, and utilizing linguistic input, based on deaf individuals learning to read (see also Lichtenstein, 1998; Yang, 2008). Some phonological source is needed which is most easily obtained via hearing. Other sources such as visible speech and touch from the face, and cued speech with the hands can help but appear to fall short of audible speech.

One reason that reading may have an advantage over listening is that since writing elicits that little voice in your head, it has two sources of information relative to just one. Utilizing multiple sources of sensory and contextual information in language processing has been a hallmark of recent theories (e.g., Massaro, 1998). Having speech, even if it's internal, as well as the written word on the page, anchors the language processor in more elaborate constraints than either modality alone (There are also rare instances of synesthesia in which speech can elicit written text, as in the mnemonist studied by Luria (1968, 1987). Writing also reduces language change which might be somewhat problematical in a speech limited metaverse.

For reading instruction, AI can automate reading experiences that can combine instruction and assessment in a seamless manner. AI can also optimize what the child is reading in terms of reading difficulty and important content to be learned. Assessment can also be made more ecologically valid and engaging by creative forms of integrated testing during reading. AI also can easily embody a reading tutor to help maintain the student's interest in reading and learning. With individually guided tutoring, reading to learn curricula can exploit the knowledge that has been organized and consolidated in various domains.

Introduction

Defining internet literacy is not a simple matter. In their review of research in an area related to Internet literacy, namely media literacy, [Potter and Thai \(2019\)](#) noted that across the 88 studies they reviewed, definitions of the term “media literacy” were idiosyncratic and difficult to categorize. Definitions were not offered in 25% of studies, and in over half of the studies, the authors presented their own unique definition. For Potter and Thai, this variability raised issues of content validity across the field of media literacy studies, and made offering a meta-analysis very challenging. The field of Internet literacy is equally difficult to categorize, since it has been recognized from the outset that Internet literacy is deictic: that is, by its very nature it is something that changes and is redefined according to context ([Leu, 2000](#); [Coiro et al., 2008](#)). The definition of Internet literacy has thus been continuously shifting, as new technologies change the nature of social practices, as the tools we use for reading and writing change, as the very nature of what we call “information” changes, and as the skill-set needed to recruit these technologies for our own benefit mutates and broadens.

The population for whom “internet literacy” might be necessary has also broadened significantly. In the 1980s, ARPANET and NSFNET, the forerunners of what came to be called “the Internet,” connected only universities and university researchers. In the 1990s, and following the invention of the WorldWideWeb ([Berners-Lee and Cailliau, 1990](#)), access to the Internet began to expand exponentially, first to all university students and their professors, then to all library users, then to school students and their teachers, and finally since the early 2000s, to all parents and their children. In many nations, Internet adoption now spans the full age-range. In 2018, Ofcom, the UK government’s telecoms regulator, reported that 69% of 3–4-year-olds went online for nearly 9 h per week ([Ofcom, 2018](#)), while in the US the Pew Research Center reported that 67% of those over the age of 65 were Internet users ([Anderson and Perrin, 2017](#)).

The ability to search and use the Internet wisely is therefore a skill that is essential not only for students, but for every citizen, and we know already that this ability is spread unevenly across populations. As Hargatti has argued, “there is a spectrum of differences associated with Internet usage once people have crossed the access divide and have become users” ([Hargittai et al., 2019](#)). We know for example that those from more privileged backgrounds tend to have higher Internet skills ([Ono and Zavodny, 2007](#)), and also that those who get their news mainly from social media are both less knowledgeable and more likely to encounter false or unproven claims ([Pew Research Center, 2020](#)). Tim Berners-Lee set up the WorldWideWeb with the intention of creating a platform for the free and open worldwide exchange of information ([Berners-Lee and Cailliau, 1990](#)). Today, many users of the Internet do not see themselves as searching for “information”: their goal may be to watch a movie, to buy a product, or to contact friends using social media. However, many mouse “clicks” not only send a request for information, they also trigger targeted and unrequested advertising, or information that is untrustworthy. Given this scenario, the issue of how we evaluate, support and enhance the ability of the citizens of tomorrow to use the Internet wisely is one of critical importance, and it is not surprising that it has become an important area of research.

As Becker found in her longitudinal study of undergraduates’ Internet use ([Becker, 2003](#)), despite a plethora of skill development programs across educational levels, even college students continued to give uncritical primacy to Google results, and if anything, were likely to place more trust in unedited online search results than in print resources that had been through an editorial process. If we share the view of Becker and other researchers who assert that Internet literacy is important not only in education but across the lifespan ([Leu, 2000](#); [DiMaggio and Bonikowski, 2008](#); [Harrison, 2018a](#)), this raises two important questions: how should we analyze students’ and others’ Internet use, and on which skills should pedagogy be focused, as we seek to prepare students to

face the future in this “post-truth” world (Keyes, 2004)? The present review seeks to address these questions, and will attempt an overview of research in the field, looking particularly at the impact of technological changes over the period from 1990, when the World Wide Web was invented (Berners-Lee and Cailliau, 1990), to the present day.

Methodology

In order to review the field systematically, a search with Google Scholar using the term <Internet search behaviour> (using both English and US spellings for the word “behaviour/behavior”) for papers published since 1990 yielded over 800,000 results. A phrase-constrained search for <“Internet search ‘behaviour/behavior’”> narrowed this down to under two hundred results, with many of the research papers focusing not only on library skills but also on two other areas: adults searching for health information, and marketing and adult consumer behavior. The areas of adult health and marketing continue to be the focus of much Internet research, but this review will focus more on research into student activity and pedagogy. From the year 2000 onwards, research studies dealing with Internet surveillance and authoritarianism began to be published, and these were clearly relevant to the present review. In order to focus more closely on children’s and students’ Internet search skills, the search phrase <“Internet searching skills”> was used. This yielded six hundred results (after false positives were excluded), ranging from the years 1995–2020, five of which were themselves research reviews or meta-analyses (Hsieh-Yee, 2001; Hargittai, 2002; Coiro and Dobler, 2007; Litt, 2013; Leeder and Shah, 2016). These research reviews offered citations leading to a further four hundred papers on Internet searching strategies and skills, and together these groups of papers formed the basis of the research reported here.

Results: three broad research themes

The three broad themes emerged from the research review: these were interaction processes, search completion outcomes, and dialogic criticality. These three themes represent roughly chronological areas of evolving research focus, which in turn reflect developments in both technology and pedagogy over a thirty-year period. Understandably enough, the early studies focused on interaction processes, with methodologies closely resembling those of papers on library searching that had preceded them. These early papers generally categorized students’ search strategies, but also reported users’ beliefs and opinions about what was in the 1990s a novel (and often frustrating) extension to library provision. Between 1990 and 2000, Internet content massively expanded, access to the Internet became easier, upload and download speed increased, and as platforms became more stable, researchers’ attention shifted toward our second theme: the outcomes of student search. Many papers reported on the efficiency of student search, with search success and search time emerging as important variables. Beginning in the early 2000s, research began to focus on our third theme, user criticality, as increased use of the Internet by younger students, combined with teachers’ awareness of the unreliability of many Internet sources, prompted more attention to factors such as how students made judgments about the material they encountered, how they collaborated in enquiry, and how they synthesized information from multiple sites.

The three broad research themes are represented diagrammatically in Fig. 1, below, which also shows details of sub-themes that will be discussed in the sections that follow.

Research into Internet users’ interaction processes

The first papers on students’ Internet searching were almost all published in library science or computing journals, and focused on interaction processes. One of the earliest was that of Catledge and Pitkow (1995), which captured client-side log files of students using the Mosaic web browser, and described search patterns such as general browsing versus targeted searching, and went on to note whether search results went unrecorded, or were saved or tagged. There was no author comment on the presumed skill or efficiency of the students who were using the system, though the authors expressed excitement about the possibility of future server-side software that might alter page design the fly, based on user history or other characteristics. Hsieh-Yee’s review (2001) of 66 papers published between 1995 and 2000 on Web search behavior confirmed that most of the early studies focused on simply describing and categorizing aspects of search activity. Attempting a meta-analysis of these studies is difficult because of the great variety of search engines. More than two thousand different search engines were in use during this period, and there was also the problem of relatively poor coverage of Internet content. In 1997 it was estimated at no more than 16% of Internet sites were covered by search engines (Lawrence and Giles, 1999). Hsieh-Yee made the valuable and prescient point that a search engine’s user model influenced both the nature and outcome of an Internet search.

This type of descriptive research was extended by Hölscher and Strube (2000) to include both interviews and prior knowledge data, contrasting “expert” and “newbie” search activity, and focusing on search terms (those of experts were on average twice as long as those of newbies). This more descriptive research, based on interviews, focus groups and self-report, carried on into the 2000s, with the work of Joo et al. (2000) and the studies of Tsai and Tsai (2003) on the relationship between self-efficacy and Web search success making a useful contribution. Litt’s (2013) authoritative and comprehensive review of research gave summaries of a further six studies that used self-report measures as part of an assessment of online activity.

Fig. 1 Themes of research into Internet activity that emerged from the review of research.

The themes of self-regulation and motivation have continued to receive attention, with Forzani, Leu, Guthrie and their co-authors arguing (2020) that although there may be many similarities between online and offline reading, affective factors such as intrinsic motivation, engagement, perceived self-efficacy, and beliefs related to self-improvement may be so different in online reading as to require a different set of questionnaire approaches. This study, which drew upon the responses of nearly 2000 participants, found that students' perceived Internet self-efficacy most strongly predicted success on an online comprehension task. The authors explained this by suggesting that online reading perhaps requires a greater degree of self-monitoring (and the ability to ignore distractions such as advertisements and extraneous links), compared with offline reading.

Developments in cognitive psychology have also had an impact on research into interaction processes, with DeSchraver's study (2012) bringing together a number of these perspectives. DeSchraver is one of many researchers who used Rand Spiro's Cognitive Flexibility Theory (2012) to capture some of the dynamic shifts of attention and focus in Internet searching, and he also foregrounded Walter Kintsch's construction-integration model (1998) to inform his discussion of how students bring together prior knowledge and emerging components of textual understanding to synthesize and create new knowledge in the ill-structured domain of learning online. These theoretical perspectives from Spiro and Kintsch offer a much deeper and more complex account of the adaptive searching and synthesis that take place on the Internet than had been possible in the 1990s.

Developments in computer power and software have also had a significant impact on more recent work on interaction processes. Research using server-side data-collection and feedback has brought new tools to the analysis of web searching, making use of client-side output such as what search terms were used and how much verbatim text was stored, but then going on to estimate how well source texts were summarized, and how well complex concepts were understood. One interesting tool that has been used in the analysis of user-produced output is Latent Semantic Analysis (LSA). LSA is a natural language processing technique that uses statistics related to factor analysis to represent a word, a sentence or a whole text as a vector, a single point in n -dimensional semantic space (Landauer et al., 1998). The power of the technique comes from the way in which it can enable comparisons between the vectors of texts that have similar theme or topic, for example a source text and a summary of that text, even if the verbatim semantic overlaps are few. For example, LSA knows that the following two sentences are closely related thematically, even though they have only the word *the* in common: 1. *Spy aircraft fly up to the stratosphere.* 2. *A pilot can take a surveillance plane high into the sky.* LSA takes account of meaning, and not simply verbatim matching between the words that make up texts; it is for this reason that it is described as a "latent" analysis.

In 2005, Omar and her colleagues (2005) applied LSA to analyze both search terms and student summaries of web content, and also used LSA to estimate text coherence as well as thematic similarity. Sung and colleagues (2016) used LSA as part of an online system that aimed to help sixth grade students in China improve their ability to write summaries. Their system used LSA to compare draft summaries of science texts with those of an expert, and the system then gave feedback in real time on a sentence-by-sentence

basis, with high-scoring summary sections (i.e., those with LSA scores close to those of the original) shown in black, and low-scoring sections shown in gray text. The highlighting changed in real time as the draft summaries were improved. The researchers found that providing the online LSA-driven feedback was associated with improved summary writing.

Another approach to generating server-side real-time feedback came from the work of Dascalu and colleagues (Dascalu et al., 2015; Gutu et al., 2016), who developed software called *ReaderBench* that uses natural language processing tools to generate automated estimates of student understanding. *ReaderBench* also moves into the domain of Computer Supported Collaborative Learning using the relatively new tool of Latent Dirichlet Allocation (Blei et al., 2003) for analyzing students' online interactions as they worked together to understand new concepts. LDA attempts to isolate the thematic content of dialogs, differentiating between scholarly and social chat themes, and estimating (and offering the students formative feedback on) their understanding. More recent studies using *ReaderBench* have looked more closely at student participation, with an in-depth longitudinal analysis of online course participation based on students' discourse and measures of text cohesion (Sirbu et al., 2019).

Search completion research

Clearly, search completion is always the implied goal of Internet searching, but it is worth examining research that has focused particularly on this aspect of Internet use. As we have already mentioned, Internet searching in the 1990s was hampered by the sheer variety of Web search tools, and by the inability of search engines to cope with spelling inaccuracies on the one hand, and search results that had usually been written for adult specialist audiences on the other. Borgman's et al. (1995) study represented a detailed and sympathetic account of the problems in Internet search completion faced by children, who understandably reported that the more complex the search, the more difficulty they had in selecting appropriate search terms to match their research goals. Similarly, many searches led to a screen with alphabetized keyword display systems, and this was a problem for many elementary school students, as were interfaces that required students to include Boolean operators (for example AND, OR, and NOT). In the 1990s, many searches led not to a specific page, but to a hierarchically organized data base, which many students found difficult to navigate. Fidel and colleagues reported (1999) that in general, high school students were beginning to become competent Internet searchers, and appreciated encountering pictures as well as text results, but that their searches often led to data-centered results rather than user-centered results.

An interesting study by Bilal (2002) reported on children's success in using the Yahhooligans! Web search engine on two types of task: teacher-assigned and self-chosen. Overall, students were more successful on the self-chosen tasks. One of the reasons for failure in self-chosen tasks, however, was problems with spelling: even in 2002, search engines were unable to deal well with misspellings, even close approximations, such as "veterinarians" for "veterinarians", or "phsychology," for "psychology". Perhaps understandably, unsuccessful searches involved more browsing than was the case for successful searches. An interesting Dutch study by Van Deursen and Van Dijk (2009) looked at the digital divide between groups of adult Internet users. The researchers made the important point that having the technology to access information is not the same thing as having the ability to locate information, and they made a detailed study of the Internet skills of a stratified random sample of 109 adult participants, finding that on average, adults were able to complete only two-thirds of closed tasks looking for information on a government web site, and fared even worse on more open challenges, such as finding out what tax or pension benefits they might be entitled to. Perhaps surprisingly, the amount of time participants spent online each week was not a significant predictor of task success; only educational level correlated highly with tasks completed successfully. Finally, they made the important point that studies based on school or university students may paint an over-optimistic picture of likely Internet search success across the whole population, and that even with universal Internet access, for people with lower information and strategic skills it will become harder and harder to use the Internet successfully to gain access to key information, resources and support for living.

As Internet use expanded, studies that looked closely at search completion also began to focus on the use made of search outcomes. Early Internet tools led users to nothing more than databases or library catalogs which were often essentially graphical interface versions of the Dewey catalog system. Gradually attention turned from whether students located the information they needed to whether they simply copied verbatim, or turned to other forms of text production. Eshet's (2004) study identified a range of new information skills demanded by the Internet, including "photo-visual literacy" (for example, reading instructions from graphical displays); using digital reproduction to create new, meaningful materials from existing ones; constructing knowledge from nonlinear, hypertext navigation; evaluating the quality and validity of information; and having a mature and realistic understanding of the "rules" that prevail in the Cyberspace (which included, for example, vigilance in relation to spam and virus detection).

Eshet's study of new aspects of digital production as a result of Internet searching has many parallels with the work of Don Leu and his collaborators at the University of Connecticut. Leu's work over a twenty-year period (Leu, 2000; Forzani et al., 2020) began with the assertion that learning on the Internet was "deictic," that is, it was fluid, dynamic, mutable, and defined according to social as well as pedagogical context. He made the point that generalizing from research in new technologies is by definition a risky undertaking, for the simple reason that as technologies evolve, it becomes increasingly difficult to make the assumption that terms such as "Internet search" actually refer to the same activity as that researched some years before. Coiro (Coiro and Dobler, 2007; Coiro, 2011, 2020) has carried Leu's approach forward with case studies and large-scale investigations into the ways in which reading on the Internet differs from reading traditional printed text, putting particular emphasis on the more complex demands that the Internet makes of readers in three areas (a) the application of prior knowledge, (b) inferential reading strategies, and (c) self-regulated reading processes. Both Leu and Coiro stress that individual agency is a factor that needs close attention: motivation,

cognitive preferences, student-centered learning and equity issues are all important factors in Internet learning. Finally, and this point builds a useful bridge to our third sub-section: a deictic perspective implies the need for new forms of critical thinking and reasoning, and also a pedagogical model that has the flexibility to adapt to new ways of teaching, and new forms of knowledge.

Research into students' criticality on the internet

As Leu indicated in his account of the deictic nature of Internet learning, the traditional forces that have exercised control over the accuracy of information distributed through print publication do not exist in hyperspace. As this fact became clearer, researchers turned their attention to the extent to which Internet users were adopting a critical stance toward the results of their search. Hirsh's (1999) paper was one of the first detailed case-study investigations of children's decisions about the relevance criteria used during Internet search. Her findings included student frustration with very slow Internet response times (this was 1999), but Hirsh also identified a number of useful relevance criteria, which included: authoritativeness, accessibility, interest level, readability, novelty (i.e., results different from those of other searches), peer interest, and currency/topicality. However, the issue of authority had only been foregrounded by two out of the ten participants.

Edwards and Bruce (2002) put forward an action-research model for Internet searching that drew upon Schön's (1987) reflective practice principles, and foregrounded the importance of criticality in evaluating a number of factors: the likely accuracy of sources, the author's intentionality, and whether the information was up-to-date. Among the papers that have already been cited, those of Eshet (2004) and Van Deursen and van Dijk (2009) included variables related to evaluating credibility. Leeder and Shah (2016) explored this area in depth, with treatment conditions that included evaluating sources in relation to estimates of the author's expertise or trustworthiness, and they concluded that embedding structured support for critical evaluation in a task had a demonstrably positive effect on student search and behavior outcomes.

In their extensive case studies of online reading comprehension strategies, Coiro and Dobler (2007) reported on the skilled use of monitoring and evaluating search strategies used by some sixth-graders (11-year-olds), often with rapid cycles of self-regulated high-level cognitive processing, shown as they navigated across multiple sites, using different search engines.

Similarly, Zhang and Duke (2011) reported on the success of an intervention with 242 students that used a framework called WWWDOT to encourage a systematic and critical approach to Internet searching. The framework encourages students to think about at least six dimensions when evaluating a website: (1) Who wrote this and what credentials do they have? (2) Why was it written? (3) When was it written and updated? (4) Does this help meet my needs? (5) Organization of website; (6) To do list for the future. This approach prompted the students to ask questions about the author's credentials and purpose, and the relevance of the site for the task in hand. The final character in their framework, the "T", encouraged the students to make a "to do" list, for example planning ahead to widen the lens of their research, or consult an expert. However, while their students did become more aware of the need to evaluate, they did not immediately make better judgments than the students in the control group. One possible reason for Zhang's slightly disappointing results is that the outcome measure was based on fourth and fifth grade individuals carrying out a task in isolation.

A recognition of the fact that working alone to solve an Internet enquiry problem may be too challenging and too lacking in feedback for many students has led to a number of approaches that in different ways seek to scaffold deeper learning. Such approaches have foregrounded the value of collaborative rather than individual work, and have broadened the pedagogic lens from simple search tasks to more comprehensive enquiry learning, based on more worthwhile and engaging tasks. It is for this reason that I have characterized this approach as focusing on dialogic criticality.

In supporting the case for collaborative online enquiry, Castek et al. (2012) made the point that the Internet is not only a rich context for learning, it is also a much more complicated one, with an almost infinite range of decision points. They reported that learners were more efficient in conducting online enquiry when they had engaging and worthwhile tasks, and when they worked in pairs to co-construct meaning.

Researchers who have focused on collaborative learning using the Internet believe that small group discussion can encourage more confident and critical evaluations, even with quite young students. Dwyer (2010), for example, combined the socio-cognitive perspectives of Vygotsky (1980, 2012) and the small-group *Thinking Together* approaches of Mercer (2009), when she set up a project to improve the reading and Internet searching capabilities of elementary school students in a high-poverty area of Dublin. Dwyer worked with students in groups of three to tackle Internet search tasks, and she reported on their moving from an uncritical "snatch and grab" approach to a "skillful investigation" level, where the relevance of each search result was assessed by systematically critiquing evidence, and matching this to the task goal. Dwyer ensured that each member of the triad took on a specific role: that of Questioner, Navigator or Summarizer, in order to promote more effective inquiry-based learning.

Harrison (2018b) adapted this approach in his study in England of elementary school triads working collaboratively to determine the trustworthiness and relevance of Internet sites, and he identified nine strategies for enhancing Critical Internet Literacy. These included "Be alert! Be suspicious!", "Read between the lines," "Make late decisions," "Integrate information across sources," and "Make joint decisions". Collaborative learning is not always popular in schools, because it can be difficult to identify the contribution of individuals, but if Dwyer and Harrison are correct in their assertion that collaborative enquiry produces better outcomes, this perhaps indicates a need to develop better tools for assessing such work rather than hold back learning because such tools are not yet available.

Dialogic criticality cannot easily be developed with “snatch and grab” Internet search tasks. As Castek and Beach argued (2013), learning to behave like a scientist in Internet enquiry requires the formulation of hypotheses, gathering data, assessing plausibility, and presenting evidence in compelling ways. Such approaches, they argue, require three things: first, collaboration between peers to collect and assess competing claims; second, multimodality, to present evidence in a variety of formats such as text, concept maps, graphs, photographs or movies; and thirdly, shared productivity, with outcomes presented not only to peers and teachers, but to a wider audience. Fortunately, there is now software that supports such approaches, such as collaborative concept-mapping tools, shared voice-notes or Post-Its, and shared highlighting apps for marking source texts or collaboratively written reports.

The studies that have been summarized above on collaborative and critical Internet enquiry indicate that this will continue to be a rich and important area of future research.

Pedagogical implications

As this review has made clear, in the field of educational technology there is a reciprocal relationship between research and pedagogy. In 1996, the US National Education Technology Plan aimed to connect every student in every classroom to a national fiber-optic “information superhighway,” and the authors made it clear that the proposed two billion dollar program was underpinned by research: “a growing body of research shows that use of technology in the classroom can increase student achievement significantly” (United States Office of Educational Technology, 1996, p. 11). In the UK, from 1989 to 2010, the National Council for Educational Technology, and its successor, the British Educational Communications and Technology Agency, piloted, organized the procurement of, and evaluated new technologies such as laptop computers, smartboards, as well as setting up a National Grid for Learning, which delivered terabytes of firewall-protected curriculum resources to schools. But as Sarah Younie pointed out (2006), the rate at which pedagogy changes as a result of educational policy, even if it is underpinned by sound research, can be very slow. The US National Education Technology Plan of 2016 also acknowledged this, and encouraged stronger partnerships between research and pedagogy: “To make better use of the existing body of research literature, however, educators and researchers will need to work together to determine the most useful dissemination methods for easy incorporation and synthesis of research findings into teachers’ instructional practices” (U.S. Department of Education, 2016).

This review has foregrounded many areas in which research has implications for practice, as educators contemplate how pedagogy will need to adapt to a world in which knowledge is mediated by the Internet. In the area of interaction processes, it is clear that student agency will be an increasingly important factor: The Internet can be an unforgiving and lonely place, and research tells us that students who are highly motivated, and who have a sense of personal involvement in their search activity, will learn more and become more expert. In the future, it is clear that server-side tools, of which LSA is just one example, will become even more powerful, and will inform and deepen the real-time learning of students who are learning on the WorldWideWeb. Search completion is becoming less important than knowledge production, and although writing for the teacher as the implied audience has traditionally been the expected outcome of learning, media production with a potentially worldwide audience will be much more common in the future.

Finally, what I have called dialogic criticality will threaten the traditional authority of the textbook: the teacher’s voice will not be the only contender for authority. In science as well as in the humanities, “truth” will be regarded as in many respects as provisional, and dialogic partners in looking for certainty will include Internet documents and online experts, as well as the students’ own classmates. In such an environment, the ability to cope with uncertainty, to synthesize information from multiple sources, and to judge provenance, relevance and trustworthiness will be paramount. However, none of the findings reported here suggest that the teacher has no place in a classroom of the future. The Internet will not displace the teacher. If anything, research over the past thirty years suggests that teachers will have an absolutely critical role to play in supporting the citizens of tomorrow to learn how to manage the Internet with confidence, criticality, and skill.

Conclusions

In 2001, Hseih-Yee argued that Web search behavior was “fertile ground for research.” This has certainly proved to be the case, and as Leu argued twenty years ago (2000), that research has had to adapt to an ever more rapidly evolving technological environment. The present review has attempted to superimpose some thematic cohesion on a very broad and complex range of research from the fields of computer science, library and information science, education, sociology and psychology, and much of that research has been valuable in moving forward both the field and the pedagogy associated with it. However, at the same time as search engines have become more rapid, more powerful, more user-friendly and more tolerant of spelling errors, the Internet has also become more dangerous. Today the Internet is viewed by businesses as primarily a commercial tool, and by many users as simply a source for gaming and entertainment (Search engine marketing statistics, 2020).

When Tim Berners-Lee set up the Internet as an open platform for exchanging information, he could hardly have predicted that it would become an ideological and political battleground, on which information provided by trustworthy sources had to compete for attention against social media which feed on dogmatism and amplify prejudice. Nearly thirty years after he invented the WorldWideWeb, Berners-Lee (2018) expressed alarm at three trends, all of which threaten not only the Web, but humanity itself. These are the ubiquity of “fake news,” the rise of personal surveillance over the Internet, and cyber-warfare: the attacks by nations attempting

to damage, corrupt or halt the Internet activity of other nations. On a more positive note, however, he pointed out that the problems we face are complex and large, but they were created by people, and they can be fixed by people too. As he put it "I want the web to reflect our hopes and fulfill our dreams, rather than magnify our fears and deepen our divisions."

It will need firm political will as well as sound educational policy to enable the educational and liberating potential of the Internet to be realized. But hopefully the research described in this review makes it clear that we already have many conceptual and computational tools that can enable the adults of tomorrow to harness the potential of the Internet, as well as pedagogical approaches that can support teachers in making those tools available, and helping to ensure that they are used effectively.

Introduction

The [RAND Reading Study Group \(RRSG\) \(2002, p. 11\)](#) describe reading comprehension as “the process of simultaneously extracting and constructing meaning through interaction and involvement with written language.” This interaction involves the reader, the text, the activity and the sociocultural context. Although the report does refer briefly to “electronic text” much has changed in the world and indeed the world of literacy since this report was published.

This chapter considers the changes to reading when you move from page to screen. It explores a range of metaphors suggesting the nested stances of the reader in engaging with online and digital texts. A definition of digital literacy is then offered to underpin the chapter. Next, the key stages in Internet inquiry and emerging research conducted in this field are explored. Following this, research examining reader response using e-books and digital texts, the reading writing connection, and the importance of text choice is presented. Finally, the implications for teaching and learning in the 21st century classroom are considered. First, the emergence of the digital landscape is documented.

Emergence of the digital landscape

We are indeed the connected generation. The Internet is flattening our world ([Friedman, 2005](#)) and almost 66% of the world population is now online ([Internet World Statistics, 2022](#)). The internet and other digital technologies, including smartphones, smart home, and wearable technologies, provide us with instantaneous and immediate access to information, entertainment, and community and affinity groups. During the COVID-19 pandemic technology provided us with a means to stay connected while staying apart through “zooming” with friends, working online with colleagues and providing online classes for our students.

Nevertheless, the pandemic brought into sharp focus issues of equity, equality of opportunity and quality in access to technology as people in different geographical locations and socio-economic classes struggled to gain access to infrastructure, resources, capacities

and reliable broadband connectivity (Scheerder et al., 2017). The pandemic highlighted systemic inequalities for student access to the Internet between low level and higher level income countries (United Nations Children's Fund and International Telecommunication, 2020) and structural inequalities within countries where an urban rural divide was observed for access to infrastructure and connectivity for remote learning (Barron Rodríguez and Cobo, 2022). For parents and caregivers, the importance of well-developed literacy and digital literacy skills were highlighted. For example, in Ireland parents and caregivers with low levels of skills in both literacy and digital literacy skills struggled to support their children during home schooling (National Adult Literacy Agency (NALA), 2020).

The "seamy underworld" (Deibert, 2020, p. 3) and shortcomings of the online world, and social media in particular, was revealed especially with regards to some toxicity in social media commentary, concerns about privacy infringements through surveillance, and the emergence of "fake news" and manipulation of political events. It is clear as boyd contends that the internet "mirrors and magnifies the good, bad, and the ugly" of everyday life (cited in Turner, 2012, p. 180).

Young people are living in media-rich households and either have, or have access to, smartphones and other technologies (Anderson and Jingjing, 2018). They are constantly online (Meeker, 2015) using technology for socialization, leisure time pursuits, education and civic participation (Lorenz and Kapella, 2020). While generally positive about their uses of technology for connectivity, connection, and entertainment, teens point to negative aspects, such as anxiety about social media, online bullying and the lack of in-person connectivity (Anderson and Jingjing, 2018). However, the widespread belief that young people are sophisticated users of technology is not reflected in the research literature (Bennett et al., 2008; Twining, 2021). We need to support our students as they grapple with the complexity and demands placed on the reader when reading digital or online texts. The section which follows explores the changing landscape as readers construct meaning with and from digital and online texts.

Constructing meaning with and from text in a digital world

The Four Resources Model ((1) reader as code breaker, (2) reader as text participant, (3) reader as text user and (4) reader as text analyst) as conceptualized by Freebody and Luke (1990) placed the reader at the heart of the reading process with the power to shape the reading transaction drawing on knowledge, thinking, culture, and experiences. In further iterations, Freebody and Luke (2003) clarified that these roles were not fixed but rather were fluid practices or resources that helped the reader to construct meaning from text. Each of the roles was necessary but the power of the model lay in the totality of the roles embedded in each other as readers accommodated each role. Of particular concern to Freebody and Luke was an overreliance in literacy instruction in schools on the reader as code breaker and text participant. They noted that this reductionist approach to literacy in schools and society ran

the risk of developing young people who are bankrupt consumers when it comes to resourcing the complex demands of contemporary societies, who need to place themselves in a kind of receivership that can manage for them interpretations of the conditions of their lives.

Freebody and Luke (2003, p. 64).

To contend with the complex demands and challenges of contemporary societies our students need to be curious about the world, they need to be critical, empathetic, and creative thinkers, and they need to be highly skilled collaborators and communicators. Students are living concurrently in a print and a digital world and we need to privilege both in teaching and learning. However, research suggests that literacy is more complex when you move from print to screen (Afflerbach and Cho, 2009; Coiro and Dobler, 2007; Kuiper and Volman, 2008). The section which follows considers the key changes to reading in both online and digital e-book multimodal formats.

The key differences of moving from print to screen

Successful print and digital reading share a number of commonalities and key skills, such as rapid decoding and word recognition to aid reading fluency; and specific strategies like, monitoring understanding, identifying and locating information, and evaluating text (Afflerbach and Cho, 2009; Pressley and Afflerbach, 1995). However, reading online and reading digital e-book texts introduces both challenges and opportunities for the reader and may require deeper levels of higher order processing skills, strategies, social practices and dispositions.

First, text is no longer the dominant mode and information or narrative may be presented in multiple ways including text, image, graph, braille, performance, video or audio modes. Moreover, print text is stable and fixed whereas online and digitized text is fluid. Second, the interaction between the reader and text may be more dynamic, opportunistic, and interactive in an online or digitized environment (McEneaney, 2006). Third, reading online is more effortful in "realizing and constructing potential texts to be read" (Afflerbach and Cho, 2009, p. 209). For example, it is the reader rather than the author who determines a circuitous pathway through a labyrinth of websites. Reader agency is heightened and it is the reader's interests that determine the reading path through

active decisions making processes. Fourth, digital texts in electronic formats (e-books) afford a myriad of possibilities to provide a “scaffolded digital reading environment” (Dalton and Proctor, 2008, p. 303) which is responsive, flexible and supportive to the needs of readers and writers (Rose and Meyer, 2002). Embedded multimodal supports include, a text-to-speech functionality, audio narration, an inbuilt dictionary, hotspots, links, and a customizable background and font size. Such embedded supports provide an interactive learning experience, but may also be irrelevant and distracting particularly for struggling (Dalton, 2014) and younger readers (Bus et al., 2019; Rowe and Miller, 2017). Finally, reader control and choice is heightened. While this may empower the skillful reader it may be daunting for a less proficient reader as they take responsibility for their own reading and learning in a shifting environment.

So a range of skills, strategies, social practices and dispositions (3SD) (Dwyer, 2020) are used by readers and required by our students in engaging in Internet inquiry and research and developing reading comprehension with digital e-books. The section which follows considers these in turn.

Skills, strategies, dispositions and social practices for reading both online and digital texts

The reader needs to be both skilled and strategic in an online and digital environment. Whereas strategies are conscious, effortful, deliberate, active and purposeful actions on the part of the reader when constructing meaning from text, skills are characterized by automaticity, fluency, effortlessness and effectiveness, often without the conscious control of the reader (Afflerbach et al., 2008; Alexander, 2006; Pressley, 2000). These terms are sometimes used interchangeably in the literature (Afflerbach et al., 2008). Paris et al. (1983) describe the active nature of reading strategies as being “skills under consideration” (Paris et al., 1983, p. 295). The online and e-book reader needs to be both skilled and strategic and needs to switch seamlessly (Afflerbach et al., 2008, p. 371) between the automaticity of the skill to the effortful use of a reading strategy. This happens in print-based environments when a student meets a demanding text. It is more heightened in an online environment where a student is in a constant state of flux moving from the automaticity of highly developed skills to conscious application of strategies as they encounter more demanding texts, modes and digital tools.

The online reading comprehension skills and strategies include activating prior knowledge, making connections, asking questions, making inferences, monitoring understanding, determining important ideas, evaluating, summarizing, synthesizing, and communicating. Dispositions for reading are important to consider in a digital or online environment. Studies (Dwyer, 2010; Leu et al., 2004; Putman, 2014) point to issues relating to self-regulation, curiosity, resilience, self-efficacy, persistence, intrinsic motivation and an ability to set learner-centered goals. A classroom culture that promotes a sense of community helps students to develop these dispositions. Social practices within such a classroom culture include working collaboratively with others, supporting each other’s thinking and problem solving to create and apply solutions in a creative way.

Digital literacy involves more than the functional use of digital devices and is the “ability to creatively engage in particular *social practices* to assume appropriate *social identities* and to form and maintain *social relationships*” (italics in original) (Jones and Hafner, 2012, p. 12 cited in Pangrazio et al., 2020). Combining the skills, strategies, social practices and dispositions needed to be digitally literate digital literacy can be described as follows:

a complex orchestration of a range of skills, strategies, dispositions and social practices to leverage technology to access, acquire, comprehend, analyze, evaluate, create and communicate knowledge in multiple modes and through multiple representations to and with a variety of audiences and in a variety of contexts for a range of purposes.

Dwyer (2020).

This definition is offered tentatively in the knowledge that literacy is a deictic construct (Leu, 2000) that is constantly evolving and morphing. Likewise, the notion of being digitally literate is better considered as becoming digitally literate in an ever-changing world (Reinking, 1998). The definition stresses the importance of developing skills, strategies, dispositions and social practices (3SD) to leverage technology in meaningful ways through a complex orchestration of processes to enhance literacy and learning in the classroom. This can only happen when teachers adopt socially mediated practices to create authentic learning environments which gives primacy to curriculum goals and learning outcomes for students before considering the meaningful use of technology to enhance literacy and learning in the classroom (Mishra and Koehler, 2006).

Other definitions stress that being digitally literate requires both cognitive and technical skills and the ability to critically examine how texts are constructed and produced, whose voices are heard and whose voices are silenced (ILA, n.d). The National Council of Teachers of English (NCTE) (2019) emphasize the importance of equitable participation to engage effectively in a networked, globalized world as people consume, curate and create actively across different contexts. Coiro (2020, p. 4) conceptualizes digital literacy as involving a “process of integration and construction in social and cultural practices” that is enacted for particular purposes and in diverse contexts.

In sum, a range of skills, strategies, social practices, and dispositions need to be orchestrated, intertwined and embedded (each necessary but insufficient individually) when reading online or in a digital e-book format. Over many years, I have been working in elementary school classrooms with teachers and students as they build online Internet inquiry skills and read and respond to e-texts

Fig. 1 The nested stances of the online and digital reader as an assembler, builder, fixer, responder, and composer.

and e-books. Analysis of many hours of observations, interviews and captured data of online screen reading suggests that the reader adopts a bricolage of nested stances when engaged with these multimodal formats. These stances can be conceptualized using the metaphors of the reader as an assembler, builder, fixer, responder, and composer (Dwyer, 2010, 2016; Dwyer and Harrison, 2018). See Fig. 1.

The reader as an assembler

The reader as assembler views the reader as an active participant in the reading process. Unlike print based text in a book which is fixed and stable, online and digitized text is fluid and opportunistic. For example, in an online environment, the reader must assemble the text to be read by creating search terms and investigating search results.

There is no predetermined route and the reader carves a unique pathway through a nonlinear, multimodal, online and digital space. Multiple reading paths are possible given the compositional nature and spatial arrangement of multimodal texts (Kress, 2010). The reader assembles the resources needed to support reading and has the power to shape the reading transaction with media and learning supports.

The reader as a fixer (adapted from Pearson, 2009)

The reader as a fixer draws on the levels of declarative, procedural, and conditional knowledge (Paris et al., 1983) that the strategic reader brings to the reading process.

In an online environment the reader engages in active decision making processes while making intertextual links (Hartman, 1995) across multiple websites and multiple modes of representation. In a digital e-book format the reader actively customizes the reading space through a layering of embedded supports like text-to-speech functionality, audio narration, an inbuilt dictionary, and external link supports like video and podcasts. A difficulty for the reader is “remaining in the reading moment” (Dobler, 2015, p. 487) and avoiding the cognitive overload when transitioning from one mode to another.

The reader as a builder (adapted from Pearson, 2009)

The reader as a builder assimilates prior experiences and prior knowledge sources with experiences from their own cultures and communities in transacting with the text (Anderson, 2004).

In an online environment the reader must supplement this range of prior knowledge sources to include navigational and online user application knowledge (e.g. activating browser features) and online informational text structure knowledge (e.g. inferring the hidden content of hyperlinks (Coiro and Dobler, 2007)). In an e-book the reader constructs meaning by fusing together a range of interrelating modes and embedded links while concurrently avoiding the “bells and whistles” that are either irrelevant or distracting.

The reader as a responder

The reader as a responder needs to construct meaning with, from and against texts (Janks, 2019). Given that anyone can publish to an online forum, the online reader as a responder acts as a gatekeeper, curator and editor of online information. This calls for heightened levels of critical thinking, critical evaluation, and media literacy skills.

The online reader must assess the credibility, authority, reasonableness, believability, author agenda, and applicability of information in relation to their inquiry purpose. In an e-book format the reader can customize and personalize the reading experience, and can respond in real time through digital thinkmarks. Digital thinkmarks are text annotations and notes which capture fleeting thoughts and responses as the reader engages with text (Dwyer and Larson, 2014).

The reader as a composer

The reader as a composer must curate, organize, summarize, and synthesize information across multiple websites and multiple modes in e-books to create, remix and communicate information to others or respond to e-books and share with others in multiple modes.

Dalton (2014) has noted that e-books and e-texts are changing the reading palette through inbuilt supports. The reader as a composer needs both receptive and expressive skills. Indeed, when reading online or digital texts it is difficult to separate the bi-directional nature of response and composition. Collaboration is an integral part of digital composing as students work with distributed expertise, in pairs or small groups (Smith, 2019).

In sum, reading in an online and digital space involves a bricolage of skills, strategies resources, and practices as the reader adopts the nested stances of assembler, fixer, builder, responder and composer when transacting with such texts.

Internet inquiry and research

Research in the area of Internet inquiry is driven by a constellation of theories. These theories include multiliteracies, (The New London Group, 2000); New Literacies Studies and multimodality (Kress, 2010; Rowsell et al., 2019); and New Literacies (Coiro et al., 2008; Leu et al., 2004). These theories provide lenses to explore the complexity of Internet inquiry from cognitive, cultural, social and affective dimensions.

The ubiquitous nature of the Internet and other ICTs is influencing both what we read and how we read information and subsequently shaping our social, political, cultural, economic and civic lives. Many students are “hanging out and messing around” (Ito et al., 2009) with technology in their out-of-school lives composing, remixing and uploading content to Face-book and TikTok, connecting with others and social positioning on Twitter, WhatsApp and Instagram and using the Internet for entertainment purposes. However, research suggest that our students are struggling to use the Internet for research and academic purposes. Moreover, Agosto (2002, p. 17) noted the “satisficing” behavior of students, (i.e. finding sufficient information to satisfy their information needs), as they browse, click, surf, and skim online. Meanwhile educators are striving to find meaningful ways to embed digital technologies to enhance and deepen student learning, to scaffold and support their students online, to challenge and nurture student creativity, and to develop students’ skills in collaboration, critical thinking and communication during the Internet inquiry and research cycle.

The key stages during Internet inquiry and research (Dwyer, 2010; Leu et al., 2004) include forming goals and asking questions, generating search terms, investigating search results, locating and critically evaluating information and communicating information to others. Fig. 2 shows this recursive cycle including key skills in each stage. We will now consider these stages in turn.

Forming goals and asking questions

Conducting internet inquiry and research in a complex, ill-structured online domain (Spiro et al., 2004) requires resilience, persistence, self-efficacy, self-regulation, and cognitive flexibility. If our students are to experience success during Internet inquiry and research they need to construct engaging questions to provide a purpose for their inquiry, set a context for problem solving, and establish a goal for learning (Castek and Dwyer, 2018).

Developing situational and in turn personal interest in the topic is key. Creating an authentic inquiry-based learning opportunity, or setting a purpose or task, based for example, on the lived experiences of students in their communities, on a real world global to local issue, on a field trip, or expert visit builds situational interest. This can spark students’ motivation, curiosity, and civic engagement. Student self-generated questions drive student interest and curiosity (Kuiper and Volman, 2008). In classrooms overt modeling by the teacher will enable students to ask higher level what if, why, how, and “I wonder” questions. In addition, encouraging student to collaborate to formulate and post questions to an online share board like Padlet (<https://padlet.com>) provides an audience of peers and helps students to generate more challenging questions.

Generating search terms and investigating search results

Generating and choosing effective key search terms involves active decision making and executive functions. Students input search terms either through typing or through voice search on a search engine. Vocabulary knowledge is key for the successful generation of

Fig. 2 Internet inquiry and research: key skills and strategies.

a just right key term for Internet inquiry. Monitoring, judging, evaluating, and revising search terms requires sufficient vocabulary knowledge related to the domain and an ability to generate synonyms related to the topic.

Key skills in interrogating search results include adopting a questioning stance to navigate the blurb and the URL with a critical eye, to evaluate the source of the information and critique the relevance and reliability of both to the task or inquiry at hand. Research suggests that elementary school students rarely go beyond the first or second result returned by the algorithm of the search engine adopting a snatch and grab or limited strategic scrolling approach rather than a speedy and skillful investigation of search results (Dwyer, 2010).

Locating information

The ability to engage effectively in the process of Internet inquiry and research through effective key word generation and investigation of search results facilitates the location of information related to the inquiry. Locating information involves skimming, scanning, and filtering information across multiple websites to separate the “wheat from the chaff” to build and update knowledge on-the-hoof in the malleable moments of an online search.

Locating information involves components, such as locating, transforming, synthesizing, and evaluating. These are cognitively demanding comprehension processes requiring dispositions and mind-sets to avoid the cognitive overload often experienced by readers in an online environment who expect information to be a mere click away.

Critical evaluation of online information

Anyone can post information on the Internet. Print-based media, with a five century start on online media, have gatekeepers, such as peer review and editors. The Internet has shifted the burden of review onto the reader to assess the accuracy, trustworthiness, objectivity and credibility of the information presented (Metzger, 2007).

Research suggests that online readers (children, adolescents, and adults) are struggling with the task (Cho et al., 2018; Goldman et al., 2012; Stanford History Education Group, 2016). A National Literacy Trust survey in the UK (2018) noted that 2% of children and young people have the critical literacy skills to ascertain if a news story is fake or real. Moreover, almost 50% of this cohort expressed anxiety about their inability to spot such stories.

Critical evaluation, critical thinking and critical multimedia skills are required to evaluate, corroborate, and interrogate the reliability and veracity of the information presented online. The online reader must “read with and against the text” (Janks, 2019, p. 561) to interrogate the perspectives presented, to question how the text is built and how the text defines the world with regard to gender, power and social issues. Elementary and middle school students draw on limited prior experiences and world knowledge (often referred to as common sense knowledge) to assess and evaluate online information. Therefore, critical evaluation skills may be developmental by nature. Students need to raise their antennae to develop a questioning stance and a healthy skepticism toward online information.

Communicating and synthesizing information

Summarizing and synthesizing information pose difficulties for our students (Dole et al., 1991). These difficulties are compounded in an online environment as students navigate across websites and modes within those websites, using short term cognitive energy to sift, determine importance, condense, and transform information.

It is important for our students to reflect on the processes of Internet inquiry and research within the community of learning in their classroom. Further, students can represent their learning and knowledge through multiple means of representation using a range of digital tools to apply their knowledge in new and creative ways. The Internet and other digital technologies expand our vision for audience beyond the walls of the classroom to a global audience.

Internet inquiry and research: classroom based research

Recent research in the area of Internet inquiry and research has focused on authentic, developmentally appropriate, inquiry-based (Castek and Dwyer, 2018; Coiro et al., 2016; Spire et al., 2019) or project-based learning (PBL) opportunities (Chen and Yang, 2019). These approaches share a number of commonalities. The focus is on curriculum alignment, global connectedness, challenging real-world problems or the lived experiences of students. Students engage in sustained inquiry, problem solving and critique which leads to action and the development of a solution, artifact, or a public product. Learning communities are established which privilege student choice and agency as students acquire and build knowledge. Social practice, collaboration and reflection among students are keys to success.

Many of the studies are transdisciplinary where students explore topics as mathematicians, historians, geographers, scientists and engineers engaging in the distinct social, semiotic, cognitive and linguistic processes of these disciplines. Student curiosity, personal and situational interest is built through reading, writing, talking, and doing. Some of the approaches assign roles to students which empower students, ensure equitable participation, and play to the strengths of individual students. For example, in the Castek and Dwyer (2018) study students engaged with the roles of questioner, navigator, responder, designer and engineer. Both print and digital texts are privileged and multiple means of expression and representation are encouraged through the use of a range of digital tools and modes.

A meta-analysis on PBL research (Chen and Yang, 2019) demonstrated a medium to large effect on students’ achievement compared with traditional classroom approaches. Recent results from a number of randomized control trial PBL studies, conducted in elementary schools, show increased achievement and significant gains in science knowledge and social and emotional learning for students (Krajcik et al., 2021) and social studies and literacy (Duke et al., 2021) when PBL is rigorously applied.

These studies show the importance of exploring real world issues in developmentally appropriate and creative ways to provide meaningful opportunities to learn across multiple disciplines (Castek and Manderino, 2017). In the section that follows we will look at the construction of meaning as students engage with e-books and digital texts.

E-book and digital texts

Rosenblatt's reader response theory (1938, 1978) has been seminal in shaping our understanding of how readers construct meaning when transacting with a text. As noted by Reinking (2008, p. 1178) reading online or on digital texts move beyond literacy events to "instantiate literacy practices because they are overtly and consistently social acts." Such literacy practices are shaped not only by the personal response of the reader but also by context, culture and identity (Rowse et al., 2019). In turn the attributes and identity of the reader/learner (*who*) as they interact with a text (*what*), in a particular context (*where*), and for what reason (*why*) shapes the reading transaction (Singer and Alexander, 2017, words in italics added).

The *who*, *what*, *when*, *where* and *why* has shaped much of the recent research work carried out around the use of e-books and e-texts in classrooms and other settings. The section which follows considers reading transaction within a community of readers; the bi-directional nature of reading and response; and the importance of choice and culturally relevant texts to engage and motivate students. As readers transact with text they draw on textual content, and their knowledge and experiences by means of the text base and situation model respectively (Kintsch, 1998; Singer and Alexander, 2017). When readers engage in a community of readers they have multiple resources at the reading construction site (Kucan and Beck, 1997) that may well stimulate and extend the individual's thinking and advance their learning and understanding.

Global literature circles

Literature circles (Daniels, 2002) or Book Clubs (Raphael et al., 2004) are systematic student-led, small group discussions around literary texts. Students adopt interchangeable roles as they read, such as artful artist, passage picker, connector or questioner, and meet to discuss their response in small groups. Simpson (2014, p. 2) describes these roles as "like shaking the crystals in a kaleidoscope. With each change of role the image the student has of a book is fractured and remade to reveal a new pattern of meaning." However, these roles may become staid and formulaic and not lead to the grand conversations envisaged by Eeds and Wells (1989).

In a series of studies (Dwyer and Larson, 2014; Larson and Dwyer, 2015) sixth grade students from the USA and Ireland read e-book versions of the same young adult novels on digital reading devices. These exploratory studies sought to investigate what happens when students from diverse cultures and backgrounds interact and collaborate in an online global literature circle when reading and responding to an e-book text. First, the students crafted a personal response by annotating the text and creating digital thinkmarks as they read. These digital thinkmarks captured the fleeting thoughts and response moments of students as they read providing an immediacy and physicality to their response (Walsh, 2013). The digital thinkmarks provided thinking time for the students and insights into their meaning making processes.

Next, the students met face-to-face in their own contexts and discussed their response. These discussions aided the students in posting questions and discussion prompts onto an asynchronous message board. The message board served as a springboard for a global literature circle where all students responded and engaged in threaded discussions around the chosen texts. Students posted responses using emoticons, font color, highlighting features and text size to establish their personal identity. They built social connection, affinity and a participatory culture (Jenkins, 2006) by discussing issues related to culture, education, religion, and personal interests while concurrently posting their responses to the text on the discussion threads. Through discussion their response to text evolved from immersion, to involvement, to interpretation as students drew on cultural, experiential, esthetic, cognitive, critical, and empathetic responses.

Analysis of data sources suggested that reading in a community of readers, in a global digital environment, deepened reader response and enhanced engagement. Further the studies suggested a blurring of lines, in a digital reading environment, between reader and writer, consumer and producer, and author and audience as the students responded to texts through the creation of blog posts, digital posters and videos using a range of digital tools. In the section which follows we consider reader response with e-books.

The bi-directional nature of reading and response using e-book texts

It is difficult to write about reading without discussing response. Exploratory and descriptive studies (Dalton et al., 2015; Smith, 2018; Smith et al., 2020) conducted in the area of e-book reader response and composition share a number of common threads.

First, multimodal composition draws on socio-cultural perspectives viewing literacy practices as socially constructed and mediated. In addition, this work is also rooted in social semiotic theories (Kress, 2010) stressing that various modes are integral to constructing meaning. Making space for students to appropriate a range of modes of response through a range of digital tools engenders critical engagement, creativity, and agency.

Second, the Dalton et al. (2015) studies in fifth grade noted the importance of a teacher scaffolded digital composing environment where the students composed retellings using PowerPoint. In retrospective interviews students expressed both a design intentionality and a metamodel awareness of how modes gelled together to create meaningful responses to folk tales. In a review of the literature of emerging bi-lingual students (Smith et al., 2020) the authors described how digital multimodal composition supported identity expression and agency as students appropriated the unique resources of multiple modes when composing.

Third, collaboration among students is important as students work in partnerships building on the strengths of each other in unique ways. For example, Smith (2018) explored three pairs of culturally and linguistically diverse students analyzing literature relating to the Vietnam War. Students responded to the literature by collaboratively designing a website, creating hyperlinked

PowerPoints and creating a podcast response from a character in the literature. The technical and multimodal composing expertise was distributed and negotiated among the pairs as they adopted various roles (designer, creative visionary and technical expert) depending on their individual strengths.

Choice of text matters

When students' lives, interests and experiences are reflected in the texts used in classrooms personal interest and investment in these texts also grows. The texts chosen should provide opportunities for deep personal and emotional connection and space for critical thinking and response as students engage with social, political and cultural issues (McLaughlin and DeVoogd, 2004). The oft referenced metaphors of windows, mirrors and sliding glass doors (Bishop, 1990) encapsulates the importance of culturally relevant texts (Sharma and Christ, 2017) where students' lives and community are present and relevant in classroom pedagogies and in their learning (Ladson-Billings, 2014; Paris and Alim, 2017). Readers should see themselves, their "funds of knowledge" (Moll et al., 1992, p. 133) from their cultures and experiences mirrored in the texts they read. Moreover, readers are transported through doors and windows into other worlds, other cultures, other experiences, other ways of being. Studies reflect the importance of culturally relevant texts that mirror, reflect, and validate cultural norms and reader experiences (Wood and Jocius, 2013) and that challenge representations of disability, stereotypes and difference by creating collaborative spaces for critical conversations around texts and in turn promoting community action projects to promote social justice (Jocius and Shealy, 2018).

In the chapter we have explored Internet inquiry and reader response as students construct meaning with and texts in a digital world. The final section considers the implications for teaching and learning within the ecology of learning in the classroom.

The ecology of learning in classrooms

In the report entitled *Students, Computers and Learning: Making the Connection* (OECD, 2015) the authors note that the promise of technology to enhance teaching, and in turn, literacy and learning in schools has not been realized

The impact of technology on education delivery remains sub-optimal, because we may overestimate the digital skills of both teachers and students, because of naïve policy design and implementation strategies, [and] because of a poor understanding of pedagogy.

OECD (2015, p. 4).

The approach to the integration of technology in schools has, in essence, been a "build it and they will come" approach. Serious consideration has not been to the goals of such integration or the trajectory by which curriculum and pedagogy could be aligned with the meaningful use of technology to enhance both (Harrison, 2015). The approach also ignores the "multiple realities" (Labbo and Reinking, 1999, p. 478) of the classroom learning ecology. The classroom learning ecology involves curriculum and pedagogies and a complex interplay and interdependency between teachers and their students, between students and their peers, in a social learning environment. It also involves relationships with school administrators, parents and care-givers, the broader community and societal and political influences.

We need to recognize the professionalism of teachers and acknowledge their professional literacy practices, and their own positions and histories as professional educators. Teachers need to engage with professional learning opportunities that are sustained, on-site, and customized to the literacy needs of the school community. In such learning communities, teachers can develop the pedagogies and strategies required to provide the scaffolded learning environments that students require as they interact with print texts, e-texts on the Internet and e-books. Working with the Internet and other digital technologies repositions the role of the teacher from the "most knowledgeable other" in the classroom to a co-creator and co-learner with students. This promotes a mutual interdependence and respect between teacher and student.

A classroom culture that encourages collaboration among students both shapes and influences how learners make sense of the world around them. These learning environments place student curiosity at the center of the learning experience and involves students in structured cross-disciplinary inquiries often based on developmentally appropriate, diverse, compelling, authentic real world issues. Students pose questions, investigate, wonder, design solutions in collaboration with others, build and act on new understanding and knowledge and reflect on new conceptual knowledge within a community of learners involving both teachers and students. It is important that students develop the "cosmopolitan dispositions and habits of mind" (Hull and Stornaiuolo, 2010, p. 89) to connect, create, collaborate, and communicate within and across a global community (Dwyer, 2018).

We need a robust research-to-practice focus that is firmly grounded in classrooms and other learning spaces to see what works and in what circumstances (Bradley and Reinking, 2011). As researchers we should work in collaboration and partnership with teachers and their students to drive assessment practices, curriculum design, learning spaces, and pedagogies. Policy development and curriculum must be firmly informed by this research.

Introduction

The longer adolescents are in school, the lower their reading performance. Empirical, longitudinal data bear this out. Traditional measures of reading like the National Assessment of Educational Progress (NAEP) show that adolescents have not improved in over 50 years of U.S. NAEP assessments ([National Center for Educational Statistics \[NCES\], 2019](#)). The 2019 Reading Report Card indicates that slight improvements for eighth graders in 2017 are trending down and slight improvements in the reading of grade 12 students, evident 5 years ago, have been also trending down. Multiple data profiles from assessments such as NAEP and The Program for International Student Assessment (PISA), indicate that so-called “achievement gaps” between the top and bottom deciles and the top and bottom quartiles of the SES distribution have been impervious to national policies intended to address the achievement gap disparities ([Hanushek et al., 2020](#)). And even though SES disparities have shown smaller gaps for early adolescents, the gaps widen for high school students. This is puzzling if SES is constant. Hanushek et al. offer two explanations for the puzzle: Teacher salary compression for high school teachers that might result in poorer instruction, and elementary grade directed policies like No Child Left Behind (NCLB) that have impacted elementary instruction and neglected later adolescents. We offer a more nuanced explanation for the trend described above that also forms the rationale for our decades of research on engaging students with multimodal digital texts.

Our research, as well as that of other scholars, indicates that the longer students are in school, the more negatively they feel about texts and their ability to comprehend them ([O'Brien et al., 2007](#)). As reading ability increases for most readers during elementary grades, once they reach adolescence, levels of reading engagement decline ([Eccles et al., 1993](#); [Smith et al., 2012](#); [Snow, 2002](#)). By the time students reach middle school, they have come to dislike textbooks and assignments connected to textbooks. Students relate to the relentless barrage of bland reading assignments only through producing products tied to grades—skimming reading assignments to answer questions at the ends of chapter sections; writing short papers summarizing or explaining key concepts; defining vocabulary terms from chapter lists; or filling out study guides. Adolescents who have been most recently characterized as “struggling” with reading are even less likely to engage with school texts ([O'Brien et al., 2007](#)). And even the most competent readers are unlikely to engage deeply with texts, or even expect to understand the ideas, language, or to immerse themselves in the reading experiences that some authors might expect.

School informational textbooks lack real authors—that is, the people who write them are not trying to make connections with the readers who carry the books around in their backpacks as dead weight. These students occasionally flip through pages, or even try to read the texts with enough purpose and determination to understand what authors might have intended. But the textbook authors usually write for publishers to glean royalties, not to engage students. They often produce inconsiderate texts ([Armbruster, 2016](#))—texts that are inconsiderate of readers who are trying to make sense of them. Considerate texts, on the other hand, are texts intentionally designed to engage learners, to stimulate curiosity, and to ultimately facilitate learning. Think about how many of

[†]Deceased Author

these considerate texts you encountered through school. Likely not many that you recall as stimulating and engaging. We can think only of young adult literature in this engaging category.

The notion of text considerateness, an important concept since the early 1980s, has been replaced with the idea of text complexity (Hiebert, 2018). Whereas text considerateness posits that even competent readers cannot adequately process poorly written (inconsiderate) texts, the latter notion of text complexity holds students responsible for understanding even the most inconsiderate texts. Yet many complex texts are simply inconsiderate. Text complexity gives authors a free pass; they are not held accountable for creating texts that lack accessibility and are approached by students with trepidation. Instead, the Common Core State Standards (CCSS) (National Governors Association, 2010) put the onus of responsibility on students and teachers—teachers are charged with preparing students to read increasingly complex texts as these students progress through the grades. Some complex texts may be well written rather than inconsiderate, but they are still not accessible because of the overall readability, dense vocabulary, and the esoteric topics they target.

The CCSS subscribe to the strategies/intervention fallacy: With strategies and scaffolded instruction, all students are assumed to be capable of reading texts that become more and more difficult at each grade level. But the efficacy of strategies and interventions holds mainly for the most successful “strategic” readers. Students who are more likely to struggle with reading earlier in their academic careers become increasingly disengaged as the texts become more complex—they feel disenfranchised from school, less hopeful of ever accessing the curriculum, and more and more excluded from the academic discourses across the curriculum. Thus, reading performance is flat over decades, the achievement gaps are sustained, and policies that led to targeted interventions fail.

Even if educators could improve “achievement and proficiency” in reading (O’Brien et al., 2008), there is little effort to improve motivation and engagement with school texts. In our work over the last 30 years, we have taken the position that disengagement from school is almost totally tied to the limits of print texts and print-centric instruction (O’Brien et al., 2007, 2001). Some readers, regardless of assessments and interventions aligned with these assessments, are not successful at reading print, and the more failure they experience, the less likely they are to engage with print texts. Indeed, the relatively recent history of the study of specific learning disabilities tied to language and literacy processing, including the recent resurgence of interest in dyslexia, highlights this fact (Soriano-Ferrer and Morte-Soriano, 2017). But the assessments, the etiologies that explain struggles, and the entire discourse around success in reading, is tied to print and equating print with text.

Add to this population of “struggling” readers—who struggle with reading for a range of reasons including documented learning disabilities—the group of capable readers who are simply not motivated enough to engage with school texts. In spite of the relatively rapid proliferation of digital media, the availability of digital tools to produce multimedia products, and the global span of social networks and other ways to connect with an expansive audience of the Internet, schools have been relatively impervious to digital advances that afford students who are disenfranchised with print to explore a range of multimodal texts that would invite them into the potential new ways of learning in school.

In this article we explore—through a brief history of three key projects discussed in chronological order—the frameworks that support the curricula and instructional approaches that can re-engage disenfranchised adolescents using the affordances of digital multimodal texts. First, we ground each project in the theoretical frameworks that informed the work before presenting curriculum exemplars of how the respective frameworks were enacted. Finally, we highlight the chronology of theoretical frameworks informing our work over three decades and synthesize what we have learned from this work in terms of the redesign of curricula and instruction for inviting disengaged adolescents into the excitement of school through multimodal affordances.

A brief history of work with disenfranchised adolescents

In this section we discuss three key projects that span the early 1990s up to our most current work at the time of this writing. We present an overview of each project before describing and discussing specific curricula exemplars of the work.

The Jeff Literacy Lab

In the early 1990s, we were on the faculty of Purdue University in West Lafayette, Indiana. One of our local graduate students, Rebecca Springs, a Lafayette, Indiana Jefferson High School teacher, called us and asked if we had a way to use computers to better assess students who were “at risk” in reading. This classification of students included about 20% of the population of the school’s enrollment of about 2300 students who had tested near the lowest quartile on a state-mandated reading assessment. This phone call led to our next project—one that spanned 7 years and laid the foundation for the topic of this article. We agreed to meet with Rebecca and her colleague, Dave Stith, to discuss the issue. We met over a series of summer meetings to devise a plan to completely redesign the curriculum for struggling readers at Jeff High. A sign with the label, *Remedial Reading Lab*, complete with white lettering etched into black plastic, was a stigmatizing symbol for people entering that space in the building. The first official enactment of the new project was to cover that sign with a brightly colored and inviting message we devised: *Jeff High Literacy Lab: Using Computers and Multimedia to Engage Students in Literacy*.

We decided, over a series of lunches in various restaurants over the summer, to morph the typical print-based curricula into one based mostly on “multimedia projects.” Rebecca and Dave remained good colleagues who became friends through the duration of the project. By the end of the summer of 1992, we were ready to launch the *Jeff High Literacy Lab*, with the new laminated sign

covering the old sign on the door. We applied for financial support from a local corporate foundation to purchase new tech tools including computers, scanners, printers, and CD drives. The grant proposal was not funded, but the principal of the high school liked our plan so much that he found money in the district's technology fund to get us started. We merely had to promise to push up the reading scores on the Indiana Statewide Test for Educational Progress (ISTEP). We immediately promised and then wondered how we actually could raise standardized achievement test scores on assessments consisting of print passages with multiple choice questions, using our new multimedia curriculum.

The curriculum

We constructed a series of broad project themes that required the students to do research and create multimedia presentations within the themes to share with us, their parents, and fellow students. In the beginning, we drew upon work defining intermediality (Tucker and Dempsey, 1991)—specifically the idea that text (print) could be used in a non-linear fashion with graphics, video and audio, and in a non-linear semiotic system to allow the creation of, and critical analysis of information. Students used tools like HyperCard or SuperCard to represent ideas in a non-linear fashion. In the earliest days of the internet, students started to tediously make Web pages. We were years away from reading about and incorporating multiliteracies frameworks (e.g., The New London Group, 1996), but we were reading about media use and critical media literacy in schools (e.g., Luke and Roe, 1993). Some of the projects were collaborative and students could select partners or group members they wanted to work with. Hence, projects had multiple components where students had choice: They could pick topics within broad themes; they could pick the combination of tools they wanted to use to create media and choose the best media for representing aspects of their ideas; and they could choose who they wanted to collaborate with on projects.

In the early 1990s, the instructional practices in the *Jeff Literacy Lab* were ahead of many of the new literacies frameworks that would eventually explain why the project was effective. But the work in the *Jeff Literacy Lab* was in tune with contemporary research in the fields of motivation and achievement motivation. For example, we incorporated frameworks that supported the importance of choice (Nicholls, 1978, 1989) and establishing self-efficacy related to completing tasks and establishing the importance and value of goals (Zimmerman et al., 1992).

We have used a particular *Jeff Literacy Lab* project over the years called the *Violence Project*. This portion of the curriculum was an exemplar among *Jeff Literacy Lab* projects because of the richness of data it yielded. We describe it again here for the same reason because exemplars from various students' work illustrates both the kinds of engagement it engendered and its overall impact on students. The broad theme of that project was this: Explore the impact of media on adolescents, using a range of media to illustrate the impact.

One group of students created an audio narrative of a collage of photos of 18-year-old Pennsylvania teen Michael Shingledecker who tried to mimic in real life, what high school football players in the movie, "The Program" (Ward, 1993) did: In a dare, they laid down in the middle of a highway so traffic would pass directly over them. In the real-life enactment of this stunt, Shingledecker was killed instantly. After a number of similar incidents were reported around the country, the death-defying scene was removed from the film. In the print text that students wrote to accompany the photo collage, they explained the scene in the film, articulating the consequences of life imitating art and the power of media in promoting the real-life tragic enactments.

In order to convey the tragedy of the death of Michael Shingledecker, the students did not tell the story with print as it had been shared in newspapers. Rather, they used audio narration with images of Shingledecker's yearbook photo, next to a photograph of his friends at his graveside. In the yearbook photo he gazes out from the page to his future of infinite possibilities; in the photo next to this his high school friends hugged each other in grief at the graveside. The message of this project: media, in this case, popular films, can change your life forever.

Through the use of numerous tech tools to create projects like the *Violence Project* over a period of over 6 years, students who typically did not engage with print literacies enthusiastically created and shared multimedia projects that included print, library and internet research on topics, and writing products. The net effect, for students who attended the *Jeff Literacy Lab* on a regular basis, was that their reading performance on the state achievement test (ISTEP), went up. But most importantly, many of the students who had given up on thinking of themselves as competent readers or writers, believed that they were improving as literacy learners and looked forward to coming to school—mainly due to the projects in *Literacy Lab* (see O'Brien et al., 2001 for more information on this project).

The Reading and Writing Intervention Class

This project spanned the 2004 through 2007 academic years, commencing after we joined the faculty at the University of Minnesota, Twin Cities. Research at local junior high site was initiated by our colleague, Rick Beach, and we saw facets of the work as a logical extension to what we had done on the topic of using multimedia projects to engage disengaged adolescents in the *Jeff Literacy Lab*. There were a number of syntheses of this new project (e.g., Beach and O'Brien, 2008), but the focus on how the *Reading and Writing Intervention Class* engaged disenfranchized adolescents appears mainly in O'Brien et al. (2007).

The purpose of the study was to examine how struggling seventh and eighth grade adolescents engaged with a curriculum co-taught by two teachers with different approaches. One teacher took up traditional English Language Arts (ELA) approaches like reading and discussing young adult novels; the other teacher engaged students in new literacies practices, mostly through the use of digital tools and media projects. As a continuation of previous work (O'Brien, 1998, 2003; O'Brien et al., 2007, 2001), we wanted to know how the students engaged with the two different curricula, one organized around traditional lessons and one organized around media projects.

The key component we drew upon from previous work in the *Jeff Literacy Lab* was to study how, overall, students improved their self-efficacy and perceptions of competency after years of feeling unsuccessful and disengaged with print texts in English language arts classes. In the *Jeff Literacy Lab* project, we studied how students, typically unengaged and disenfranchized from print-centric curricula, attained personally relevant goals and developed agency and perceptions about competence as they collaborated on media projects. In previous research we studied how the use of digital media literacies in the production of multimedia projects engaged those students who were typically unengaged. In the newer work in the *Reading and Writing Intervention Class* there were two foci: (a) studying how engagement with new literacies practices (Lankshear and Knobel, 2003, 2006, O'Brien and Bauer, 2005), particularly media projects, improved adolescents' literacy performance and sense of competence; and (b) studying their engagement when they had opportunities to participate in activities that grounded them more in their sense of place and within their popular media culture (O'Brien et al., 2007).

The curriculum

As the title of the project implies, the students engaged in activities in which reading and writing were integrated both through traditional approaches, and also via new literacies practices through the use of digital tools or in relation to students' experiences in digital spaces like playing video games. The *Reading and Writing Intervention Class* was designed to support students who had been classified as struggling readers and to boost their achievement in both reading and writing so the students could pass the state high stakes assessments required to eventually graduate from high school.

On the traditional side, students read young adult novels and participated in guided reading with various strategies (e.g., mind-mapping activities). The teacher read orally while students followed and interspersed this whole-class oral reading with discussion, dramatization of stories, and questions. The focus on reading and engaging with a range of activities related to young adult novels was exclusively print based.

Within the new literacies approach (the *Intervention Class*), students participated in a range of projects. They also engaged in writing activities like digital productions of stories, producing comics with *Comic Life*, writing wikis, storyboarding, and writing and producing a radio play—complete with dramatization and sound effects. In addition, they produced PowerPoint presentations about topics such as their favorite video games, or young adult novels they had read. One of the most extensive projects was the *Sense of Place* project in which students collaborated on multiple assignments where they engaged in new literacies practices based in their multiple place-based identities associated with communities, neighborhoods, and school. This focus was taken up by Beach (e.g., see a later synthesis by Beach, 2014) and was an inquiry into engaging students based on connecting them with places and spaces of their experiences which are tied to their own and others' social and cultural constructions of "figured worlds" (Holland et al., 1998).

An example of the *Intervention Class* was a project called *Sense of Place*. This curriculum focused on students constructing a prototype of an imaginary town that they modeled after Lake Wobegon from the long-running Garrison Keillor's *A Prairie Home Companion* radio show. Students devised stories based on events that occurred in the town and publish their stories in the school district Moodle site. Another project featured students in self-selected groups as they constructed VoiceThread presentations in which they represented their favorite places in school with images and constructed narratives. They often picked the favorite place among all places they represented, and using the VoiceThread Comment tool either wrote a print entry or selected audio of video modalities to explain why they picked a particular place and how they felt about it. In studying the project one of the things we looked at was why students picked a particular modality to construct narratives about school places and how they supposed that representation of their feelings about school places would be taken up by peers.

The *Intervention Class Sense of Place* project provided evidence of how students, who are typically disenfranchized, found multimodal new literacies practices enabled by collaborative projects engaging—clearly more engaging than typical print-centric practices. Certainly, the labeling associated with terms like struggling and intervention, and the broader deficit discourse that constructs one's identity as a learner once they have been identified for special classes, had a negative impact on the students. But at the end of the *Reading and Writing Intervention Class*, students reported that they perceived that they were improving their reading and writing regardless of what print-centric state and school mandated assessments showed.

The Frederick Douglass High School Disciplinary Literacy Project

In this project, a collaborative team of six University of Minnesota faculty members and graduate research assistants worked with 5 Minneapolis high school social studies teachers to collaboratively design instructional units that integrated disciplinary literacy practices into the curriculum (Lemanski et al., 2020). The *Disciplinary Literacy Project* (DLP) started when we were contacted in the fall of 2014 by high school history teachers who stated that they needed support in helping students in their International Baccalaureate (IB) program understand the complex texts in the curriculum. Due to a strong social justice orientation at the school, the IB program, previously restricted to students who have strong academic records, was opened up to a range of students representing the demographic of the building. The school of 1100 students included 92% students of color, and 90% of students coming from poverty. Before the DLP redesign of the curriculum mostly white students and a small portion of students of color who identified as college bound were enrolled in the IB program.

After an initial meeting in the fall of 2014, a partnership was established that worked together on the DLP for the next 5 years. The partnership was designed to include bi-weekly collaborative meetings (Ortmann et al., 2015; O'Brien et al., 2017) in which we discussed general issues related to the DLP collaboration, informed by our shared readings and what we had observed in classes that would inform the redesign. After 2 years of establishing this “baseline” of the current teaching practices, student engagement and disengagement with the content, the use of texts and discourse surrounding the texts, and student motivation, we were ready to implement the new approaches.

The curriculum

Our baseline data included studying the IB Diploma Program, specifically teachers and students enrolled in the IB history courses at Frederick Douglass. This work was first comprehensively documented by Van Deventer (2018) in a doctoral dissertation based on the project. In the 2-year, *Diploma Program History, Higher Level* we started to work with two teachers and multiple classes they taught. We added one teacher who taught multiple classes of a pre-IB course titled US History. We later added an IB Global Politics class, which we will use as an exemplar below. The core team of the early work included the three teachers and one university faculty member and two graduate research assistants (GRAs) who continued to work together to meet in collaborative sessions to share ideas, to discuss classroom observations, and to plan specific modifications to units.

In the fall of 2016, we received funding to expand the DLP and plan three more years of activities. We were able to enlist the help of three more faculty, a social studies educator, a historian, and another literacy researcher, as well as fund assistantships for three GRAs. We started to ramp up the DLP curriculum re-design by including funded summer institutes to work on designing units for upcoming academic years. With the added expertise of a historian, we started to design lessons around a model we eventually termed the “uncoverage” model, based on the work of Calder (2006). Our “uncoverage” design drew upon Calder’s critique of the notion that teaching means coverage—passing on information to students, assigning textbook reading, lectures, and then assessing these as decontextualized. We started to work in collaborative “uncoverage” sessions (Lee et al., 2020a; Lemanski et al., 2020) and developed essential questions (EQs) that, if answered by students using a range of resources, would be an indicator of engagement and learning. A key part of the “uncoverage” framework was that we would only select, write, or adapt texts that would address the essential questions. And the texts that were selected would be multimodal, depending on positive affordances.

One example of how this DLP collaborative planning worked was in an IB Global Politics class. The unit topic was the war in Syria. The teacher, Dawn, due to “uncoverage” sessions planning, was more likely to only use primary source material she had tailored to be more accessible by shortening the length of the pieces, substituting in more current or less technical vocabulary, and framing the text with literacy scaffolding and historical thinking prompts (Lee et al., 2020b). In addition, also due to “uncoverage” planning, Dawn systematically drew from multimodal sources like videos, maps, diagrams, and even used a sort of kinesthetic reinforcement consisting of the use of token manipulatives representing countries and proxy groups that could be moved around on a map of Syria.

All of these components were designed into the unit because they allowed students to respond to each of three EQs. An illustrative instructional approach Dawn used was to project, using a document camera, portions of a key text and a scholarly article we wrote to be more accessible by reducing the readability by putting in more signaling and using more graphics. During these sessions, she would model for students how she found information that might answer the EQs and annotate important points. She often accomplished this goal by talking aloud to model her thinking related to disciplinary thinking categories we were working with.

How did *The Fredrick Douglas Disciplinary Literacy Project*, as exemplified by Dawn’s unit design and teaching, continue the program of research we started in the 1990s? The students in the IB program, most of whom would be disenfranchized by a typical IB curriculum, were motivated and engaged when we reconfigured the curriculum to include multimodal texts tailored to EQs, used student-selected collaborative groups, and promoted teacher scaffolding of both literacy and disciplinary thinking. This DLP, which we explain in terms of “strategic engagement,” was a main focus of Lee’s (2020) doctoral dissertation study, and was included as a component in multiple presentations we made during the duration of the project. We elaborate on how the DLP extended the previous work in the theoretical frameworks section below.

Theoretical frameworks that have informed our work

In retrospect, the *Jeff Literacy Lab* project started because of our interest in the relation between motivation and engagement and literacy, specifically the connection between ability perceptions and achievement (Anderman and Maehr, 1994; Dillon, 1989; Pintrich and Blumenfeld, 1985). From a socio-cognitive view, students identified as being “at risk”—the term of choice for struggling readers in the early 1990s—were viewed as having little chance of success from middle grades onward due to early negative perceptions about ability. The research suggested that negative perceptions of ability could be a stronger prediction of success or lack thereof than actual evidence of success (Dweck and Leggett, 1988; Nicholls, 1978, 1989). As learners progress through school, they have an increasing awareness of ability as being separate from effort; and ability is viewed as a stable factor. The result: If you do not think you have ability, and your added effort does not yield the outcomes that ability does, why keep trying on tasks on which you expect to fail?

From this perspective, disengagement can be viewed as a defensive posture, designed to avoid feelings of incompetence. *The Jeff Literacy Lab* students represented the population of students who learned early in their academic careers that even if they exerted

effort, they did not read as well as their peers. Their population was also defined as the students whose lack of success was amplified each year they were in school. By the time they entered high school and were referred to a program called *Remedial Reading*, they were more likely to view it as a stigma than a reasonable attempt to boost their achievement and perceptions of competence.

Shortly after the inception of the *Jeff Literacy Lab* project, we were influenced by the reading engagement theme of National Reading Research Centers (NRRC) (Alvermann and Guthrie, 1993). The focus of the NRRC represented a major shift away from assuming that everyone could and would read if they received adequate strategies instruction and scaffolding, to an examination of why students chose not to engage in reading even if they could “read.” The NRRC goal of improving motivation to read was key in our research that would span not only the *Jeff Literacy Lab* but other projects over the next 25 years. A publication that synthesizes our perspective on the role of motivation to engage adolescent learners has been revised over the years, and was recently updated in O’Brien et al. (2022).

At the inception of the *Jeff Literacy Lab* project in 1992, we believed that two aspects of what were then termed “multimedia oriented” projects were sufficient to instill higher motivation and, to our way of thinking from the research, more engagement in literacy for “at-risk” adolescents. These two aspects included: (a) technology novelty effect based on an assumption that students would simply be motivated to engage in literacy if it gave them access to a lab with computers and other tools that most of the school did not have; and (b) students’ beliefs that using all of these high-tech tools was better than most of the print-based tasks they had come to dislike and feel incompetent using. Some of our earliest work on using multimodal texts to engage typically disenfranchized students (O’Brien, 1998; O’Brien and Dillon, 2002) was guided by this key question: How can we disrupt the cycle of disengagement and diminishing perceptions about ability through the use of media projects? The earliest publication in which we synthesized the theoretical foundations and instructional implications of the *Jeff Literacy Lab* work appeared in O’Brien (2003), but much of the description of the project can be found in O’Brien et al. (2001).

By the time we started on the *Reading and Writing Intervention Class* research, our work drawing from social cognitive perspectives on motivation and achievement motivation was complemented by our colleague, Rick Beach’s, focus on using activity theory (Cole and Engeström, 1993). Instead of studying only how media projects contributed to the engagement of students due to the technology novelty effect and the modal affordances of using digital tools, we started to look at learners’ dimensions of practice. This perspective focused on how students used mediating artifacts within activity systems, and how the use of these artifacts made sense within the classroom community to achieve the goals of specific projects. The broader goal was the same: If students saw more value in, and connection to, their personal lives with work in school, they would be more motivated to engage in that work.

At this point we had also moved from social cognitive perspectives into sociocultural perspectives, and the basic premise that new literacies practices based in digital tools and digital spaces are shaped by, and contribute to, the social contexts and discourses in which adolescents participate (Barton et al., 2000; Gee, 1996). Adolescents have increasing opportunities to move beyond print to engage in media-rich activities within new literacies frameworks (Alvermann and Hagood, 2000; Gee, 1996; Kamil et al., 2000; Kist, 2005; Lankshear and Knobel, 2003). Using and producing media was not only an alternative to the restrictions of, and adverse reactions to print that many disengaged students experienced, but it also presented an opportunity to be part of participatory culture enabled by a wider and wider range of online communities (Jenkins, 2009), and to gather wider audiences with which to share ideas and feelings and to unleash hidden passions. By the time the *Reading and Writing Intervention Class* project in the mid 2000s was developed, our focus was on how multimediating and the process of using and producing media (Lankshear and Knobel, 2003) served to not only transform learners’ sense of competence, but as a way to make sense of the world (O’Brien, 2012; O’Brien and Ortmann, 2017; Hinchman and O’Brien, 2019).

The later interest in the connection between multimodality and learning across disciplines for us, as well as many other educators, was catalyzed by the publication of *The New London Group’s* (1996) theory of multiliteracies. In contrast to the print-centric notion of learning from textbooks mapped to curriculum guides that reproduce stilted notions of culture and learning, the New London Group steered educators away from the local to multicultural diversity and global language and discourses and toward situated learning grounded in students’ lives and experiences.

As we started the *Frederick Douglass High School Disciplinary Literacy Project* in the 2013, we developed a framework O’Brien et al. (2017) based on the notion of multimodality that moves us from writing and print to visual images—moving from the “page to the screen” (Kress, 2003): In understanding and constructing meaning, drawing from a wide range of semiotic tools, learners are more able to navigate and create understanding by using a range of modes (Bezemer and Kress, 2015). Sometimes a short, written description may engage learners; at other times, only a graphic design affords the meaning that authors intend. Sometimes a photograph might enable the emotive dimension needed to engage learners; at other times, only a video with audio narration would suffice. In the *Frederick Douglass High School Disciplinary Literacy Project* and the framework that guided it, we realized that unlike previous frameworks that relied on scaffolding students to read print, we had to move to the use of multimodal texts and multimodal notions of textuality to support students’ engagement and learning. And, as we noted, in order to decide what texts to include in planning instruction, and the modality of those texts, we drew from Shulman’s (2005) and Ciccone’s (2012) notion of signature pedagogies as applied to teacher education, with a particular focus on texts, textuality, and learning, what counts as knowledge, and approaches to critiquing and dismantling rigid disciplinary approaches to using print texts. As previously described, for particular notions of unit planning, we drew from Calder’s (2006) extension of these ideas as applied to the discipline of history.

What we have learned over decades of work

In this final section, we reflect on what we have learned. Here, we will summarize without reference back to the projects or the particular theoretical frameworks from which we have grounded the work. Our parting thoughts are framed as both reflections and conclusions.

Print-centrism Dwarfs multimodal textuality

Education will continue to move “from the page to the screen.” There are almost infinite possibilities in engaging almost all students by exploring the digital textualities—the many ways of weaving meaning of, and emotional connection to school disciplines and topics within those often mundane and boring subject areas. Over the decades, the adolescents we have worked with, within projects where teachers and students helped us redesign learning, have been engaged, creative, and have redefined their perceptions of competence. But, we have not been able to generalize these approaches and students’ experiences developed in the relatively controlled settings of our projects to broader school learning cultures and across disciplines. That said, we believe that many of the approaches and ideas we developed are transferable. Overall, if educators do not address motivation and engagement of learners and new digital textualities, we fear that some of the disengaging aspects of signature pedagogies that have prevailed over the years will persist into the foreseeable future.

The print text and textbook are intractable

In concert with the point we just made, there is little evidence that print and its typical institutionalized artifacts like textbooks and worksheets will disappear any time soon. They are fading, gradually, but often the digital multimodal replacements are not carefully considered in terms of either engagement or learning potential. This is evidenced by the rapid, often unreflective movement of school curricula online during the COVID 19 pandemic (initially occurring in March 2020). Literacy itself is still typically compartmentalized as a set of skills rather than situated practices, many of which are related to structures and modes of learning. The notions of situated multiliteracies is conceptually challenging for teachers trying to use it to design units and lessons tied to broader curricula goals.

The importance of engagement is neglected

To date, our work and related work of other scholars appears to have had little impact on what is defined as engagement and learning in school, particularly as it is tied to literacies. The Institution of the School and the technocratic rationality that shores up dominant notions of assessment, achievement, and mapping and meeting standards, seldom draws from research on engagement related to the artifacts and learning processes of adolescents.

There is hope

Our recent experience with COVID has reshaped our thinking. Districts and schools in the US and many other countries have taken notice of the increased levels of disengagement among many students moved out of face-to-face environments and daily interactions with peers and teachers. But the more positive complement to this disengagement is that educators have been forced to pay more attention to ways to engage students with digital tools, multimodal texts, and creative ways of building online learning communities. More parents are also aware of what disengagement looks like in their own children, and how various teachers, schools, and districts have explored digital multimodal ways to keep students engaged online. Time will tell, but this experience of forced online, digital learning, particularly how it can be used to engage learners, may persist in hybrid future notions of schooling.

In this article, we explored some broader issues of student disengagement tied to institutionalized assessment and instructional practices, print-centrism articulated in textbooks, and policies that define success or failure in school. We described three projects that we constructed to address disengagement through the intersection of digital literacies, multimodality, and disciplinary learning, woven together with practices used to engage learners. Through this chronology of work, we reflected briefly on what we have learned, and offered some conclusions and possible predictions of where this work is headed. As many others build on our scholarly efforts, and as teaching and learning become more coherently tied to multimodal textuality, we hope that this brief chronology helps ground future progress in welcoming disenfranchized learners into the excitement of schooling.

Writing today is often multimodal, involving the fluid interweaving of visuals, sounds, movements, and texts in digital formats, such as videos, webpages, blogs, social media posts, and podcasts (to name a few). Over the past two and a half decades, researchers have begun to examine how an expanded view of writing across multiple modes and in digital environments affects youths' communication and learning in a variety of contexts. This growing body of research has explored how youth multimodally compose online for their own purposes outside of school (Black, 2009; Hull et al., 2010; Kim, 2018; Lam, 2009) and how it can be effectively integrated into the classroom (Cimasko and Shin, 2017; Dalton, 2020; Jocius, 2013; Miller and McVee, 2013).

This chapter surveys the landscape of research focused on adolescents and multimodal composing. First, I summarize three theoretical perspectives that have been influential in guiding the field thus far. Next, I describe four prominent themes in the extant research, particularly how multimodal composing fosters (a) agentive identity expression, (b) the reshaping of classroom spaces, (c) the development of multimodal designers, and (d) multimodal composing-to-learn. I then synthesize the research by examining youths' processes when composing with multiple modes, including the collaborative, mediated, recursive, and affective nature of digital writing. This chapter concludes with a discussion of new directions for research on youth and digital multimodal composing.

Prominent theoretical frameworks in multimodal composing research

Three primary theoretical perspectives have influenced research on youth and multimodal composing: sociocultural theories of composition (Gee, 2012; Prior, 2006), multiliteracies (New London Group, 1996), and social semiotics (Jewitt, 2009; Kress, 2003, 2010). In the following, each of these interrelated perspectives is briefly described with examples of how they have been employed in multimodal composing studies.

Sociocultural theories of multimodal composing

Multimodal composing research has been guided by sociocultural theories of literacy, particularly New Literacy Studies, which recognizes that meaning-making is always positioned within specific social contexts and that it is these contexts that give meaning to literacy practices (Barton and Hamilton, 1998; Gee, 2012). Moving away from "autonomous" models that view literacy purely as a cognitive activity, emphasis is placed on literacy within contexts that reflect particular worldviews and accepted practices (Heath, 1983; Scollon and Scollon, 1981; Street, 1984). As described by Gee (2007), "Literacy has no effects—indeed, no meaning—apart from particular cultural contexts in which it is used, and it has different effects in different contexts" (p. 82).

A sociocultural view of multimodal composing emphasizes how the process is influenced by a constellation of social, cultural, material, historical, technological, and individualized factors (Prior, 2006; Vygotsky, 1978). Foundational to this perspective is the understanding of meaning-making as mediated action between composers and their cultural tools (Wertsch, 1998). Multimodal research has employed this perspective to understand how tools—both material and intellectual (Vygotsky, 1978)—are leveraged and negotiated by students during collaborative composing (Bruce, 2009; Gilje, 2011; Ranker, 2008). Additionally, some studies explore how composing tools and modes are imbued with certain constraints and affordances that affect students' processes, collaborations, and meaning-making (Jocius, 2013; Leander and Lovvorn, 2006; Smith, 2017b).

Other research employing a sociocultural view has examined how multiple modes serve as conduits through which youth agentively represent themselves (Hull and Nelson, 2005; Lewis and Fabos, 2005) and participate in social action (de los Ríos, 2017; Prior, 2006; Vasudevan et al., 2010). As described in more depth later, a large body of this work examines how youths' identities are sedimented (Rowse and Pahl, 2007) through their layering of modes—expressing personal goals, interests, and cultural and linguistic backgrounds (Alvermann, 2008; Kim, 2018; Pacheco and Smith, 2015; Rowe and Miller, 2016).

Multiliteracies

Vital to a multiliteracies framework (Cope and Kalantzis, 2000; New London Group, 1996) is the understanding that all meaning-making is multimodal, including linguistic, visual, audio, gestural, and spatial elements, which are in dynamic interaction with one another during communication. In high-tech, globalized, and culturally diverse workplaces, the New London Group (1996) emphasized how a multiliteracies approach aids students in dealing with modern literacy demands, fostering, in particular, critical engagement and empowering meaning-making. The multiliteracies emphasis on the saliency of cultural and linguistic diversity involves providing opportunities for composers to connect to their unique lifeworlds—finding their own voices and leveraging their cultural knowledge and experiences.

Multiliteracies pedagogy (New London Group, 1996) emphasizes how *design* is a key process for multimodal meaning-making, particularly the cyclical relationship among Available Designs, Designing, and The Redesigned. While Designing, composers make new use of old materials (Available Designs) to create The Redesigned. Based on this framework, numerous studies have examined youths' purposeful use of modes when designing for different purposes and audiences (Chandler-Olcott and Mahar, 2003; Dalton, 2020; Mills, 2010; Thibaut and Curwood, 2018). Other studies have drawn from youths' perspectives to understand how their goals and creative visions are achieved in their modal designs (Dalton et al., 2015; Smith, 2018).

A multiliteracies framework has also been employed in research examining how to scaffold students' multimodal composing processes in the classroom (Ajayi, 2015; Callow, 2006; Mills, 2006). For example, Tan and Guo (2009) illustrated how a teacher employed a multiliteracies pedagogy by providing students with overt instruction, critical framing, and situated practice (New London Group, 1996). Other studies have also examined how students can learn the requisite *metalanguages* to effectively communicate through multiple modes (Mills, 2009; Shanahan, 2013).

Social semiotics

A social semiotics (Jewitt, 2009; Kress, 2003, 2010) framework also emphasizes how various modes are integral to communication. Modes are sets of socially and culturally shaped resources for making meaning. They are not fixed or universal, but fluid and created through social processes within specific communities (Kress and van Leeuwen, 2001). This perspective elucidates how meaning is created through the synergistic interaction between different modes. Linguistic modes are no longer privileged in communication but, instead, are one part of a multimodal palette of semiotic possibilities for composers (Kress, 2010). The unique interweaving of modes creates generative messages that no single mode can express independently (Jewitt, 2009; Stein, 2008). Thus, endless combinations and intersemiotic relations can be crafted by combining different modes (Unsworth, 2008).

Social semiotics also elucidates how modes are shaped by sociocultural factors that influence how they are employed in communication. A mode carries with it specific communicative affordances, histories, and possibilities for constructing meaning, which also interact with and contribute to the constructed multimodal message (van Leeuwen, 2004). Multimodality studies have examined how youth draw on the affordances of specific modes (e.g., visuals, sounds) in their digital products (Dalton et al., 2015; Hull and Nelson, 2005; Jocius, 2013; Shanahan, 2013). For example, research has illustrated how students explain the affordances of nonlinguistic modes for conveying emotions or abstract concepts (de los Ríos, 2018b; Skerrett, 2018), whereas other students prefer the stability and linearity of writing for expressing ideas (Smith, 2017b). Social semiotics has also been instrumental in studies examining how youths orchestrate modes for varying purposes and audiences (Ho et al., 2011; Lenters and Winters, 2013; Toohey et al., 2012).

Research on adolescents and multimodal composition

In the following, I describe prominent themes in the research on multimodal composing and adolescents, including (a) agentive identity expression, (b) the reshaping of classroom spaces, (c) the development of multimodal designers, and (d) multimodal composing-to-learn.

Agentive identity expression

The majority of studies on multimodal composing illustrate how youth explore and express aspects of their identities through digital projects. By having expanded opportunities to convey ideas with multiple modes, students are engaged during the meaning-making process and often use their compositions as a means to agentively (re)present themselves and their cultures.

Numerous studies emphasize the ways in which composing with visuals, sounds, and texts offers adolescents *multiple points of entry* (Jewitt, 2008) into a composition for expressing, negotiating, and affirming their identities (Danzak, 2011; Goulah, 2015; Honeyford, 2013b; Hughes and Morrison, 2014). The semiotic freedom of choosing and combining different modalities creates space for students to represent aspects of their lives in individualized ways (Kim, 2018; Poveda, 2012; Wilson and Boatright, 2011; Zenkov et al., 2011). Students' purposeful infusion of their identities into their work ranges from showcasing out-of-school interests and skills (Gynne and Bagga-Gupta, 2015; Skerrett, 2012; Wiltse, 2015), to making popular culture connections (Smith, 2018; Wilson et al., 2012), and sharing their cultural histories and practices (Anderson and Macelroy, 2017; Pacheco and Smith, 2015; Pandya et al., 2015).

A growing body of research illustrates how multilingual students, in particular, employ their cultural and linguistic repertoires while orchestrating modes to feature and bridge aspects of their transnational identities (Jocson, 2012; Mills et al., 2016). Skerrett (2012, 2013) demonstrates how transnational students activate their multiliterate and multilingual capacities across lifeworlds to construct positive identities in school. Similarly, Kim (2018) describes the nuanced ways a middle school student "drew upon her entire semiotic repertoire" (p. 39) to share her transnational Korean-American identity. Her multimodal composing involved the meshing of images, music, gestures, dance, drawings, text, and speech to communicate with different Korean and American audiences. Other studies (Honeyford, 2014; Noguérón-Liu and Hogan, 2017) report how multimodal projects support students in juxtaposing, comparing, and contrasting different cultural practices from their transnational identities in empowering ways.

Research also suggests that students can agentively (re)position themselves through multimodal projects (Anderson et al., 2017; Pandya et al., 2015; Paris, 2010; Vasudevan et al., 2010). Studies show how students' impactful self-authoring can be achieved through crafting multimodal *counternarratives* (de los Ríos, 2018a; Price-Dennis and Carrion, 2017; Walsh, 2009). For example, Ajayi (2015) describes how three female students in Nigeria were able to "rewrite themselves" through their digital projects and question the social production of gender (p. 238). Cummins et al. (2015) research on identity texts with Indigenous students illustrates multiple examples of students shaping identities through collaborative multimodal projects. The authors suggest that creating identity texts through personal narratives that interweave multiple modalities "constitutes a counter-discourse that repudiates the devaluation of identity that is frequently embedded in educational structures and relationships" (Cummins et al., 2015, p. 558). When examining the multimodal practices of Black male adolescents, Vasudevan (2006) explains how "digital and visual modalities make it possible to perform and author new selves that are not only resistant to dominant images but also offer new sights of inquiry and exploration" (p. 214).

This substantial body of multimodal research underscores how the nature of multimodal composing offers new opportunities for students to strategically showcase aspects of their lives. Through the freedom of composing with multiple modes, semiotic space is opened up for students to achieve multiple co-occurring composing goals—students share ideas along with their identities.

Reshaping classroom spaces

Kress (2003) asserts that multimodal literacies can offer "an inversion in semiotic power" (p. 3) that allows composers to express themselves in innovative and empowering ways not typically afforded by traditional literacies. Research demonstrates how the integration of digital multimodal projects often reshapes classrooms by allowing students to leverage their cultural and linguistic backgrounds (Noguérón-Liu and Hogan, 2017; Vasudevan et al., 2010), reach authentic audiences (Kim, 2018; Pacheco and Smith, 2015), promote social justice (de los Ríos, 2018; Walsh, 2009), and share their out-of-school expertise (Gynne and Bagga-Gupta, 2015; Skerrett, 2012; Wiltse, 2015).

Along with multiple entry points, studies situated in schools illustrate how multimodal composition offers meaningful platforms for adolescents to engage with audiences across time and space (DeBruin-Parecki and Klein, 2003; Price-Dennis and Carrion, 2017), thus challenging rigid physical and temporal boundaries that define classrooms. Studies describe digital projects that help students to connect with their local communities and family members (Noguérón-Liu and Hogan, 2017; Pacheco et al., 2017), as well as with international audiences (Lantz-Andersson et al., 2016; Toohey et al., 2012). Pacheco and Smith (2015), for example, documented how students living in the Southeastern United States drew upon Spanish, Vietnamese, Bahdini, and English linguistic resources in an English-medium enrichment eighth grade class. The authors described how, at times, students used English to communicate with English-speaking peers, but also used non-English resources to communicate with family members not present within the classroom, thus positioning this language as a valuable semiotic resource. This work and other research (e.g., Kim, 2018) shows how the digital and mobile nature of multimodal composition can afford the use of varied multilingual resources, thus reshaping the classroom's semiotic ecology (Scollon and Scollon, 2004).

In addition to shaping what counts as legitimate composing in "traditional English literacy classrooms" (Smythe and Neufeld, 2010, p. 488), multimodal composition can reshape the classroom as a locus for social justice and activism. Research on multimodal composition suggests ways that composing can restructure classrooms as spaces for building community (Bell et al., 2011; Honeyford, 2013a; Van Sluys and Reinier, 2006), enacting social action (Albers and Frederick, 2013; de los Ríos, 2017; Price-Dennis and Carrion, 2017), and critiquing unequal social structures (Vasudevan, 2006; Walsh, 2009). For example, de los

Ríos (2018) demonstrated how Latinx bilingual adolescents created short Vine videos to post on social media that “ma[d]e meaning of power and privilege in their lives, their communities, and problematize[d] greater oppressive discourses” (p. 11).

Studies also show how traditional power hierarchies can be disrupted through the integration of technology in the classroom. Teachers often take on the role of facilitator while students collaboratively learn together. In particular, adolescent composers who possess certain technical skills are positioned as “experts” in the classroom and able to guide their peers (Oldaker, 2010; Smith, 2017b).

Developing as multimodal designers

Some studies illustrate how students develop as intentional designers through the multimodal composing process. Often with careful teacher scaffolding, students learn to leverage the unique communicative affordances of multiple modes when conveying meaning for distinct purposes and audiences. Additionally, research emphasizes how multimodal composition offers students new and different possibilities for communicating ideas.

Targeted scaffolding strategies support students in gaining understandings of multimodality, which they then, in turn, apply to their own digital projects. Through explicit instruction, students learn metalanguages (New London Group, 1996) and principles of design, along with examining how different modes can be combined for different rhetorical purposes (Ajayi, 2015; Dalton et al., 2015; Tan and Guo, 2009). Callow (2006), for example, explained how sixth grade students were explicitly taught visual concepts and grammars (Kress and van Leeuwen, 1996) that informed their own designs. Some studies emphasized the importance of students critically analyzing multimodal examples before composing (Ajayi, 2015; Callow, 2006; Mills, 2006; Ranker, 2008). These focused analyses—often involving multiple viewings of real-world and/or student-created examples—allow students to recognize and discuss the multidimensional nature of multimodal meaning-making.

Research also demonstrates how students develop a semiotic awareness of the affordances of different modalities during their composing processes (Burke and Hardware, 2015; Davis and Reed, 2003; Hepple et al., 2014; Vincent, 2007). In particular, students identified the communicative potentials of visuals, sounds, movements, and texts for communicating specific messages and observed how they could be combined for generative effects (Callow, 2006; Smith, 2018; Tan and Guo, 2009). Ho et al. (2011), for example, examined the perspectives of 158 seventh grade students in Singapore after constructing multimodal virtual museums. Students reported a growing awareness of the impact of multimodal forms of expression, including viewing visuals and color as playing significant roles in meaning-making, and an increased understanding of how modes conveyed multisensory dimensions in their virtual museums.

Some research illustrated how students articulated intentional uses of specific modes in their designs for targeted communicative effects, purposes, and audiences (Lenters and Winters, 2013; Kim, 2018; Smith, 2018; Tan and Guo, 2009; Toohey et al., 2012). Through retrospective design interviews, Dalton et al. (2015) detailed how fifth grade students who created multimodal folktale retellings expanded on their modal decisions in nuanced ways. In particular, students demonstrated a *metamodal awareness* by connecting their use of modes to story grammar elements (e.g., setting, character, action, problem, and resolution). Student explanations included labeling multimodal elements in relation to rhetorical functions (e.g., “poor music,” “happy color”) and describing how they wanted modes to “go together” in their designs (Dalton et al., 2015).

Research on multimodal composing in schools emphasizes how students feel they can communicate in new and different ways not typically afforded by traditional academic writing (Davis and Reed, 2003; Hepple et al., 2014; Vincent, 2007). In their seminal study, Hull and Nelson (2005) described how Randy a teen participating in an afterschool program, was able to construct a “different system of signification and a different kind of meaning” through his multimodal poetry. Hull and Nelson “argue[d] that the meaning that a view or listener experiences is qualitatively different, transcending what is possible via each mode separately” (2003, p. 251). These studies emphasize how multimodal composing offers students a rich communicative palette from which to share complex ideas in innovative and personalized ways.

Multimodal composing-to-learn

A growing body of recent research illustrates how students can work toward academic learning goals through multimodal composing in schools. This emerging research points to the potential of *multimodal composing-to-learn* (Smith, 2019b): that is, nonlinguistic modes serving as valuable tools for thinking (Wertsch, 1998) to support students’ literacy and content learning.

Most of the research focused on academic learning is situated in English Language Arts (ELA) classrooms where students interpret and analyze literature through digital multimodal projects (Ajayi, 2015; Davis and Reed, 2003; Lenters and Winter, 2013; Pacheco and Smith, 2015; Pacheco et al., 2017; Smith, 2017b, 2018; Tan and Guo, 2009). Smith (2019b), for example, illustrated how 10th grade culturally and linguistically diverse students analyzed literature through creating multimodal hypertext presentations, podcasts, and videos. In particular, Smith (2019b) found that students drew upon visuals and music to conceptualize literary themes as well as elucidate specific vocabulary and literary devices.

In addition to interpreting and responding to literature, some research in ELA contexts examined relationships between multimodal composing and academic writing. Many of these studies emphasize the constraints teachers face and how they attempt to infuse technology in the curriculum while concurrently designing projects with standards and state-wide assessments in mind (Goulah, 2015; Lenters and Winters, 2013; Tan and Guo, 2009). Research suggests multiple modes offer students opportunities to develop ideas and understand important aspects of writing, including narrative structures and discursive strategies (Dalton et al.,

2015; Hepple et al., 2014; Honeyford, 2013b; Pandya et al., 2015). For example, Vandommele et al. (2017) assessed the integration of multimodal composition on L2 learners' academic writing development in Belgium. Their multilevel analysis revealed that students who created a multimodal website had greater growth related to the development of writing skills compared to students who participated in their usual writing tasks. Specifically, students who composed multimodally in school showed growth with regard to six measures (complexity and text length in one task and communicative effectiveness, content, lexical diversity, and text length in the other task).

Lastly, a few studies have explored how students engage with content beyond ELA through creating digital multimodal projects (Cummins et al., 2015; Goulah, 2015; Rao, 2015; Zheng et al., 2014). Cummins et al. (2015) research on identity texts demonstrated how multilingual students could work toward the dual goals of identity expression and content learning. They provided a variety of examples to this end, ranging from junior high emergent bilingual students learning about the migration patterns of Canadian geese through designing a digital book, to students creating photo stories that focused on learning number sense problems, concepts of time, and financial literacy. There has also been a handful of studies exploring how students can problem-solve and engage with issues of climate change through creating digital multimodal compositions (Beach and Smith, 2020; Goulah, 2015; Jiang et al., 2019).

Research on multimodal composing processes

While the majority of research on youth and multimodal composing has focused on the positive outcomes previously described, less research has closely examined multimodal composing processes. These studies detail how multimodal composing can be a collaborative, mediated, recursive, and affective process for youth.

Collaborative multimodal composing

Across contexts, research portrays multimodal composing as a social and collaborative process. When creating outside of school, adolescents are involved in online participatory cultures (Jenkins, 2008) where their work is shared with receptive audiences (Ito et al., 2010). Research in schools shows that students typically collaborate in pairs or small groups—building on each other's strengths, discussing their design decisions, and providing one another with feedback (Bruce, 2009; Ho et al., 2011). Students often undertake a distinctive piece of the project on their own and then integrate their contribution into the overall composition (Goodman, 2003; Smith, 2019a; Wikan et al., 2010).

Digital literacies research also emphasizes the critical role of student interaction as a mediating factor during collaboration. For example, Wikan et al. (2010) described how the complex and multilayered nature of multimodal texts requires intensive interaction during the composing process. Smythe and Neufeld (2010) found that students were more likely to offer substantial feedback compared to more traditional writing assignments. Students questioned their peers' rhetorical moves and made their semiotic decisions transparent through discussions (Bruce, 2009). Multimodal collaborators are often exposed to their peers' alternative thinking processes, which can, in turn, allow the adaptation of their own thinking processes (Beach et al., 2016). Finally, research illustrates how interactions (both online and verbal) during multimodal composing can particularly support the composing processes of emergent bilingual students who often translanguage, discuss design decisions, and consider larger audiences (Goulah, 2015; Ho et al., 2011; Pacheco and Smith, 2015; Smith et al., 2017).

Mediated by composing tools

Research illustrates how composing tools also mediate the multimodal composing process in impactful ways (Gilje, 2011; Halverson, 2013; Smith, 2017b). The unique features of digital tools and composing programs often shape how students design. For example, Ranker (2008) found that when composing a video, fifth graders used the tool bar function in Video Studio Editor, which displayed the layers of each mode, including sounds, voiceovers, and images, to help organize their work and see the semiotic relationship between modes. Ranker concluded that the visual resources made available by the composing tool affected students' processes and allowed them to see the "interactive synergy" between modes (2008, p. 228). Similarly, Jocius (2013) examined how high school students created multimodal retellings by choosing one of two digital formats—a multimodal PowerPoint presentation or digital video. Findings revealed that the compositional tool greatly influenced the types of modes students employed to create their retelling and the various communicative weights each mode carried.

Some studies also illustrate how adolescent composers can be restricted by the technology at hand when creating their visions (Gilje, 2011; Leander and Lovvorn, 2006; Smith, 2017b). Gilje (2011) described how three high school students in Norway interacted with an editing tool while creating a short fiction film. At two different stages in the editing process, when trying to blur an image and rework a sound clip, the group could not achieve the effects they "actually wanted" (Gilje, 2011, p. 52), thus becoming frustrated and giving up on achieving their specific vision.

Recursive process and modal preferences

Research that closely examines multimodal composing illustrates it as a complex and recursive process with students skillfully traversing modes (Bruce, 2009; Smith, 2017b). Bruce (2009) found that high school students composed in a nonlinear fashion when creating digital videos. Students overlapped the videotaping and editing processes—often beginning to edit while still filming other parts of their videos. As a result of these ground-breaking findings, Bruce (2009) developed a video composition process model conceptualized as a continuum on which composers recursively shuttled back and forth between visually conceptualizing ideas they wanted to videotape and evaluating how they would go about creating those ideas.

Smith (2017b) conducted a comparative analysis with urban 12th grade students composing across three distinct multimodal projects in response to literature. Through the development of multimodal composing timescapes (Fig. 1), the findings revealed how students' rapid traversals of modes were mediated by the convergence of the digital tools, the multimodal genre, and students' modal preferences and skills. For open and flexible composing tools (e.g., PowerPoint and website programs), where modes could come into contact in endless ways, students exhibited similar recursive composing patterns and often relied on the same mode (e.g., visuals or writing) for entering the process and building new content. Additionally, students viewed their preferred modes as carrying unique affordances (Kress, 2010) for communicating their creative visions. For example, one student described preferring to use words to precisely express her ideas, whereas another student shared how "sometimes there really are no words to put into effect what I'm feeling, so pictures just really help me express myself a lot more" (Smith, 2017b, p. 272).

Similarly, Smith et al. (2017) found that emergent bilingual adolescents also demonstrated and expressed different modal preferences (i.e., visuals, music, or text) when composing. Students launched into creating their projects through a preferred mode and worked with that mode first to create a foundation before layering other modes. Students' cross-modal traversals often increased with time as they became more comfortable and skilled with multimodal composing. Furthermore, the authors found that recursion occurred on multiple interrelated levels simultaneously—across modes, across phases of the process, and across sections of students' multimodal projects.

Affect-driven

Recent research also explores how adolescents' multimodal literacy practices are driven by subconscious affective intensities (Ehret and Hollett, 2014; Lenters, 2016; Schmidt and Beucher, 2020; Wargo, 2015) and interactions with material artifacts (Zapata and Horn, 2017). This work challenges the New London Group's (1996) view of composers as intentional designers (Leander and Boldt, 2013). For example, Smith (2017a) described the "noncognitive" and affective dimensions of 18-year-old Emily's multimodal online practices as she wrote a series of young adult gothic novels. Emily's work was often "operating at the margins of her consciousness" as her narratives bled into her everyday life and she experienced affinity toward her characters (p. 13). Digital

Fig. 1 Multimodal composing timescapes depict how students traverse different modes and their modal preferences when creating digital projects.

literacies research from this viewpoint, which often focuses on out-of-school contexts, complements research on multimodal composing processes by expanding the possibilities of how adolescents are inspired to create with digital tools.

New areas of exploration

Research has made important advances in terms of understanding how youth can agentively express their identities (Halverson, 2010; Skerrett, 2013), leverage their cultural and linguistic backgrounds (Honeyford, 2014; Pandya et al., 2015), and communicate in innovative ways (Hull and Nelson, 2005; Smith, 2018) through multimodal composing. A large body of studies has shown how the integration of digital writing in the classroom can disrupt engrained hierarchies (Smythe and Neufeld, 2010) and center students' collaborative meaning-making (Beach and O'Brien, 2015).

Given the current empirical landscape, in the following, I discuss new areas of exploration for research on youth and multimodal composing, including gaining a multifaceted understanding of composing processes, exploring innovative meaning-making through multiple modes, and examining the effective integration of digital tools in the classroom. Furthermore, I discuss the need for a wider variety of methodologies and a critical perspective in multimodal composing research.

Multifaceted view of multimodal composing processes

Only a handful of studies have closely examined youths' processes with regard to meaning-making across modes (Bruce, 2009; Ranker, 2008; Smith, 2017b; Smith et al., 2017), illustrating it as a collaborative, mediated, recursive, and affect-driven process. More needs to be uncovered about the processes of multimodal composition at a finer grain of detail. In particular, the following questions need to be explored: What meaning-making processes occur as students compose across modes? How do the processes of multimodal composition differ based on mode, digital format, purpose, and genre? How is multimodal composing similar to and different from print-based writing processes? What is the role of collaboration during the composing process? So far, only one model has been advanced for understanding the process of video composition (Bruce, 2009); more models need to be developed that acknowledge the great diversity in composers, contexts, and digital tools.

Additionally, research has presented sharp divisions between the portrayal of youths' design intentionality in opposition with a subconscious and emotionally-laden multimodal composing process. The field should continue working toward disrupting isolated conceptions of multimodal literacy practices to understand the complex nuances and multiplicities involved in multimodal composing. This includes understanding how multimodal composing can be shaped based on a blend of co-occurring factors. Research focused on the nuances of multimodal composing processes from multiple perspectives and grain sizes would help educators in understanding the complexity involved and how to best support students in the classroom.

Multimodal meaning-making

Research shows emerging evidence that expressing meaning through multiple modes in digital environments can mediate student learning (Cummins et al., 2015; Vandomelle et al., 2017; Zheng et al., 2014). Most of the research focused on academic learning is situated in ELA classes, demonstrating how multimodal composing can support the interpretation of literature, rhetorical elements, and academic writing. Limited studies have explored learning in other content areas. More research is needed on multimodal composing-to-learn (Smith, 2019b) and on understanding the possibilities of multiple modes for mediating and transforming academic learning (Moje, 2009; Yi, 2017). Future work might ask how the process of representing and moving meaning across different sign systems serves as a tool for thinking (see Siegel, 1995) or how digital multimodal products represent authentic disciplinary meaning-making (see Manderino and Casteck, 2016). Other valuable questions to explore could include the following: Can the knowledge and skills developed through multimodal means be traced to other contexts and genres? How is the process of meaning-making across modes different from monomodal communicative processes? Can student learning through multimodal composing be built upon and traced to other contexts and genres (e.g., academic writing)?

In agreement with others (Dalton, 2013; Grapin, 2019; Siegel, 2006), there needs to be an expanded view of meaning-making in the classroom. To that end, future research should examine the unique communicative affordances of multimodal composing for supporting students in developing and representing their ideas. Furthermore, we should reexamine the privileged position of writing in and continue to explore meaning-making and learning potential possibilities through multiple modes of expression.

Integration into schools

Future research is also needed on how multimodal projects can be effectively integrated into diverse classrooms. Some studies provide recommendations for scaffolding, including explicitly teaching metalanguages and principles of design and asking students to critically analyze multimodal examples to understand the communicative effects when modes are combined for different purposes (Ajayi, 2015; Callow, 2006; Dalton et al., 2015; Tan and Guo, 2009). Additional research should address how teachers can integrate technology to meet the needs of students, including scaffolds that foster intentional designing, collaboration, and audience awareness (Dalton, 2013; de Oliveira and Smith, 2019; Jocius, 2020). Very little research thus far has examined best practices for assessing students' multimodal compositions (cf. Anderson and Kachorsky, 2019) or the quality of students' designs.

An additional area underexplored in the literature is how to prepare teachers for these rich pedagogies (Hundley and Holbrook, 2013). More attention should be given to supporting teachers in developing an understanding of multimodal pedagogies, as well as in expanding their own skills as digital multimodal designers.

Multimodal methods

Multimodal composing studies have overwhelmingly relied on qualitative research methods, including case studies, ethnographies, and action research (see Smith, 2014; Smith et al., 2021 for reviews). These methods have been generative in terms of illuminating students' perspectives on the affordances of multimodal composing, their detailed composing processes, and design nuances in their digital products. However, with only a handful of studies employing design-based research, mixed methods, or quantitative methods, a wider variety of research methodologies are needed to gain a multidimensional understanding of youths' multimodal composing. It would also be beneficial for more research to trace youths' multimodal practices across formal and informal settings, as well as in material and virtual spaces (e.g., Ehret and Hollett, 2014; Stornaiuolo et al., 2017). Finally, multimodal methods for closely analyzing or displaying modal processes need to continue to be developed (e.g., Anderson et al., 2017; Domingo, 2012; Hull and Nelson, 2005; Kim, 2018). New methods for capturing, analyzing, and presenting research on multimodal composition need to be innovated to fully understand youths' complex multimodal composing processes and products.

Critical stance toward multimodal composing

As is evident from this review, research on multimodal composing has overwhelmingly reported the various positive aspects for students, including engagement, identity expression, and the reshaping of classroom pacing. Echoing the concerns of others (Hull, 2003; Jocius, 2018; van Leeuwen, 2015), future research must also take a critical stance toward multimodal composition and consider who participates in these practices, where the practices are enacted, and how the practices shape different learning opportunities. Only a few studies have explicitly addressed the challenges associated with implementing multimodal composing pedagogies and, similarly, the ways in which these pedagogies might constrain students' learning, collaborations, or communication (Hellmich et al., 2021; Mirra and Garcia, 2020; Paris, 2010; Ware, 2008). Mills (2006) cautioned that students might have "differential access to multiliteracies"; for instance, Anglo-Australian, middle-class students could have more opportunities to engage in productive multimodal practices than "those who were culturally or socio-economically marginalized" (p. 305). Future research is needed that critically examines how multiple factors—including the learning context and students' access to technology—might also pose barriers to empowerment and effective multimodal meaning-making.

Conclusion

Important strides have been made in the past two and a half decades toward understanding the pedagogical promise of digital multimodal composing for culturally and linguistically diverse youth. This scholarship has revealed the many unique benefits of digital writing for adolescents, including agentive identity expression, the reshaping of classroom spaces, and the development of multimodal designers. Building upon what we have learned thus far, it is important for research in this area to continue critically exploring the complex processes involved when youth compose with multiple modes. Future scholarship should also continue expanding research methods, instructional contexts, and scaffolding models in order for educators to leverage the unique meaning-making possibilities of digital multimodal composing in the classroom.

Introduction	583
What literacies?	584
Enacted and emergent narrative understandings	584
Character action, design, context and game rules	584
“Transformative” literacy actions	584
Digital games as multimodal systems	584
Procedural literacy	585
School-based literacies and digital games	585
Perspectives on gaming—a positive or negative influence on learning	585
Gaming fosters complex thinking and increases motivation	586
The construction of paratexts	586
Can gaming increase literacy performance?	586
Gaming promotes the development of “soft-skills”	586
Digital literacies & digital games	587
Conclusion	587
References	588

Introduction

Digital games are, like film before them, a massive world-wide entertainment industry, one that continues to capture the attention of both youth and adults. As the strongest grossing creative medium of the 21st century (Witkowski, 2021), digital games and their adjacent media (Twitch.TV, YouTube) have been valued more for their entertainment than for their educational uses and impacts. That said, digital games have for quite some time been considered an integral part of digital literacies, included in discourses around “21st century skills and competencies” that focus on how video games provide contexts for problem solving and collaboration (Dede, 2009; Garneli et al., 2017).

Literacy has always referred to mastery over the means by which culturally significant information is coded (de Castell et al., 1981), and nowadays a great deal of culturally significant information, impacting social, economic and political practices, is coded in the form of digital games. On that argument, digital gameplay and game making merit consideration as critical components of contemporary digital literacy practices.

There are two related views of games and digital literacy that we will overview in this entry. The first argues that there are new and emerging literacies distinctive to digital games that can only be acquired through playing. The primary questions provoked by this view is what literacies are recognizably *unique* to digital games and how are these acquired informally, outside of school contexts? A related question is how to support those game-based literacy practices in school contexts. This in turn connects to the relatively conventional second view of games’ contributions to literacy, arguing that *traditional* literacy skills can be developed through playing digital games. This viewpoint provokes its own question: how does playing digital games support traditional literacy skills such as reading and writing? What “constellation of literacy practices” (Steinkuehler, 2007, pp. 299–300) does playing digital games support?

For our purposes, digital games can be separated into broad categories:

- Those built especially for educational purposes,
- “Serious games,” which can include games for health, learning games, and games whose goals and/or outcomes are defined by the player and/or game designer as “serious,”
- “AAA” games (or “commercial off the shelf games”),
- Casual, often mobile games (like Angry Birds, Candy Crush, or Plants vs. Zombies), and
- “Indie” games, meaning those designed by smaller, sometimes one-person games studios.

Many of these game types have been implemented in classroom settings, in a variety of contexts, to support educational outcomes that range from language learning and digital literacies to health and mathematics. Overall, the impacts of learning through digital games have been “inconclusive” at best (Tobias and Fletcher, 2012; Young et al., 2012), and yet digital games remain a core touchstone for discourses on 21st century learning, in and out of school.

What literacies?

Enacted and emergent narrative understandings

Part of the appeal of digital games is their profound cultural influence. Outside of classroom contexts, however, and from the standpoint of digital literacies, video games constitute a unique set of communicative media that incorporates linguistic and multimodal forms. Game-based literacies have most typically been understood through comparative analysis—what difference and similarities to print-based literacies are invoked through playing video games and interacting with their attendant paratexts and media? One direct method of comparison is to explore “reading” and “writing,” a game’s narrative, as playing games involves making choices within a set of narrative affordances both enabled and limited by the rule structures of the game. In other words, as a player progresses through the game and makes choices: through those in-game choices, players “write” their own narrative within the constraints of the game, tacking between what Jenkins (2004) has referred to as “enacted” and “emergent” narratives. For Jenkins (2004), emergent narratives are those that a player chooses as they move through the game environment, with these narratives varying depending on what the player does. Enacted narratives are those that the game provides to the player in the form of “backstories” (about characters), cut scenes, and environmental storytelling, in effect, what the game does. The point is, digital games afford complex storytelling environments that “that the player inscribes with his or her own intent” (Steinkuhler, 2010, p. 61).

Character action, design, context and game rules

Narratives and narrative understanding are but one aspect of digital game literacies. Others that have been explored include those by Apperly and Christopher (2012), include:

1. “Actions,” which “define *how* the space(s), and the objects in it, will be used by the players” (p. 118)—that is, how the character moves, what it can and cannot do, and so on;
2. “Design,” including the ability to customize playable characters (or avatars), as well as modding (i.e., modification), and programming customized functions and game mechanics;
3. The “situation” or “context” of the game—i.e., where players are playing, with whom, and using what technologies; and
4. “Systems”: a game is a system with a particular set of rules and mechanics that are learned through playing the game. The focus on procedural or system-level understanding of how games work is, relatedly, something that Ian Bogost’s work has focused on. He argues that: “Playing video games is a kind of literacy. Not the literacy that helps us read books or write term papers, but the kind of literacy that helps us make or critique the systems we live in” (Bogost, 2008, p. 136).

“Transformative” literacy actions

Similarly, but different in its emphasis on sociality through play, Tekinbas (2008) views “gaming literacy” as: (a) not only understanding systems, but how to “transform” them through, for example, modding; (b) making use of “out of game” resources, digital and non-digital (game guides, FAQs, walkthroughs); (c) understanding the social norms of play; and (d) collaboration. Each of these understandings of video games as a form of literacy emphasizes their unique properties as a representational medium distinctively different from the linear logics and command and control systems of books or film. Video games, too, are rule-bound systems, but ones which player agency is paramount, where “playing” involves degrees of choice and interactivity that readers and viewers are not afforded in other media.

Entwined in the above examples are a combination of both “reading” (playing) and “writing” (making) digital games. Playing successfully demands fluency in decoding the games narratives, characters, rule systems, operations and mechanics. Designing and making digital games demand skill in encoding, are provide ways of taking up “producer”-like relations to video games (Gee, 2004). Making games, it has been argued, supports “hands-on” learning that allows students to explore what it game making entails (Kafai and Burke, 2016) or make use of increasingly accessible game development tools that introduce them to the programming logics and paradigms, integral to computational literacies (Denner et al., 2019).

Several studies have found that programming games increases familiarity with computational concepts (Hsu and Wang, 2018; Kazimoglu et al., 2012; Lee et al., 2013; Leonard et al., 2016) and enhances problem-solving abilities as students learn to write and debug their own code (Akcaoglu, 2014; Allsop, 2016; Hamlen, 2017). Important as it is, Kafai and Burke (2016) have pointed out that game design is not just about learning programming logics, but is also about bringing together and integrating multimodal resources like images, texts, sounds, rule structures, and narratives. Andrew Burn argues, similarly, that the process of making games is both technological and conceptual: “For Vygotsky, tools were also semiotic: they involved the manipulation and creation of signs; and though his work pre-dated multimodal theory, in some ways it anticipated it” (2021, p. 67). In the next section, we overview the centrality of multimodality to understanding video games and literacies.

Digital games as multimodal systems

As Gunther Kress has persuasively argued, all communicative forms are multimodal (Kress, 2010). Video games are no different, and entwined within the acknowledgment of playing games/reading games as engaging in literacies is the view that digital games

inescapably include multiple modalities—image, text, sound, gesture, embodiment—in a variety of combinations. For example, if you are playing in a massively multiplayer online game such as *World of Warcraft*, your screen will include the game world, with its elaborate narrative backstory and whatever the avatar you control is doing. It will also display a plethora of choices available to you, of weapons, clothing, appearance, capabilities, depending on the character you are playing and what level you are in the game. You will be controlling your avatar through a keyboard or game controller, and those keystrokes and/or button pressing will result in a virtual embodiment of some kind of action. Game player action must be built up from predefined elements (walking, running, sword fight) that can be made operational only once players learn to decode, all at once, visually/acoustically conveyed environmental requirements like “*Zombies! Run!*” and encode that game-based imperative into both skillful and strategic manual operation of color-coded icons on a controller, using keypresses guided by symbols (find the images and Stick em in here) which, resonant of the alphabet, have themselves no meaning—nor does digital code. And in that kind of learning, a recognizable literacy comes into play.

As for kinds of oral communicative competencies developed through your play, you could also be either in real-time voice chat with your guild (other players who group together within the gameworld), or text chatting, or both, in your own language, or not, and the list goes on. The point is, video games, especially for highly engaged players, present a complex, changing, and multimodal environment. The semiotic score of meaning-making then happens across multiple convergent channels of information communicated during gameplay, and all of those semiotic resources combine to compose the distinctive forms of meaning expressible in and through digital games and play.

Video game literacies include digital and nondigital “meaning making that hinges on player recognition and understanding of various multimodal sign systems” (Abrams, 2016, p. 2319), and theories of multimodality can help us to better understand the complexities of digital games (Hawreliak, 2018), including what types of learning occurs through playing games.

Procedural literacy

A rhetorical analysis of videogames as a medium has been introduced by Michael Mateas and Ian Bogost, whose analytical frame for visual and multimodal modes of communication, Bogost (2008, 2011) introduces “procedurality” as a form of communication and, thus, literacy in video games. Procedural rhetoric refers to the structures and mechanisms through which games communicate and express meaning, and to the accomplishment of persuasion through the coding and process-oriented rules of the game. The required and prevented procedures as well as procedures that are rewarded or reprimanded work together to express ideas and arguments in a mode distinctive of, and arguably unique to, video games (Bogost, 2011; Hawreliak, 2018).

Hawreliak’s (2018) example is *Dys4ia*, an independent game created by Anna Anthropy (2012). *Dys4ia* is a short, proceduralist game which explores the experiences of Anna as a transwomen and her journey to begin using estrogen. Her story is told through short mini games accompanied by text. Each minigame represents some aspect of her experience such as the first one in which the player is asked to fit a block through a maze it does not fit. Next to it is the text “I feel weird about my body.” The player often faces minigames that are impossible to win and receives no instruction on how to play through each one, to better represent the road-blocks and challenges Anthropy faced, and, perhaps, evoking the sensation of at times feeling lost and helpless at the lack of guidance and help along the way during his quest to transition. At the end, the player is presented with a game of pong in which they are supposed to remove all the bricks blocking their way. However, only one layer of bricks will disappear while others remain, indexical of the seemingly irremovable barriers transwomen face in society.

Mateas (2005) uses the term “procedural literacy” as the ability to understand “how code operates as an expressive medium” (p. 102). To Mateas (2005), procedural literacy includes the ability to read and write code. For Hawreliak (2018) and Bogost (2008, 2011), procedural literacy is about understanding what the code does “as a representation of culture as much as that of dynamic systems” (Bogost, 2007, p. 252). From this perspective, players can and often do gain procedural literacy when playing, whether through repeated play or purposeful, critical reflection on a game’s procedural rhetoric and its embedded ideologies.

School-based literacies and digital games

As digital games gained popularity, scholars started to question what kind of benefits games might have in relation to school-based literacies. As illustrated above, a wide range of diverse literacies are exercised through playing digital games. However, school-based literacies, most often referring to the ability to read and write, and the applicability of using digital games in the classroom, have been of particular interest to researchers. Digital games have also been used to encourage the learning of second languages (Sauro, 2021) as well as the digital literacies which are viewed as essential for academic and career success in the 21st century (Gee, 2004; O’Mara, 2017; Rowan, 2017).

Perspectives on gaming—a positive or negative influence on learning

However, game-based learning has been a topic of a significant epistemological divide within both education and popular media. Video games are often portrayed as inherently violent, negative influences on youth (Ferguson et al., 2008; Ferguson, 2015). Identities of laziness and immaturity are often ascribed to avid gamers (Bergstrom et al., 2014), and the nature of gaming as an addiction

has been well-debated among parents, teachers, and scholars alike (Markey and Ferguson, 2017). In contrast, arguments can also be made for the positive impacts of gaming on literacy and learning, given that as players interact with games, they are required to engage in a range of literacy practices, to varying extents. They must exercise traditional, school-based literacies such as reading to navigate menus, understand tutorials and item descriptions, or interact with dialog options. Simultaneously, digital games may offer an avenue for building digital literacies such as typing, utilizing databases, and understanding common digital interface systems.

Gaming fosters complex thinking and increases motivation

Another argument related to games and literacies views digital games as a substitute for other media such as books or films in language, novel studies, or media curricula, with the underlying assumption that the innovative and interactive medium of games should increase motivation and engagement. Through this lens, digital games can be viewed as powerful communication engines, capable of helping players engage with complex ideas in increasingly unique ways. Dezuanni and O'Mara (2017) argue that games open a door to impassioned learning within and outside of the classroom.

As Gee (2004) has also argued, when players are deeply engaged in play, they gain opportunities for meaning making, identity construction, and the acquisition of technical registers, all of which qualify as “advanced” levels of literacy. Dezuanni and O'Mara (2017) provide the example of literacies gained when playing *Minecraft*, describing insider knowledge, or the ability to understand complex systems specific to the game and communicate about the game collaboratively. In this way, the literacies exercised through *Minecraft* mimic those academic literacies in which students are expected to maintain in-depth knowledge on complex fields and communicate said knowledge using subject-specific terminology.

The construction of paratexts

As players become invested in games, they may engage in creating or consuming paratexts. Paratexts refer to individual or official game-brand content surrounding a game. These paratexts include guidebooks, online forums, mods, memes, fanfiction, fan art, and much more, and engaging with paratexts is a significant part of how players participate in gaming culture and affinity groups online (Burwell and Miller, 2016; Consalvo, 2007). The creation or consumption of these paratexts often rely heavily on school-based literacies such as reading and writing, and they may be constructed independently or through collaboration or interaction with others (Apperly and Walsh, 2012). While there has been some work that argues that playing/reading a game, or exploring its related paratexts might support school-based literacy practices (Apperly and Walsh, 2012; Burwell and Miller, 2016; Sauro, 2021), there is still a paucity of empirical in-school research on the subject.

Can gaming increase literacy performance?

While paratexts may be viable contexts for literacy and language production, more debate has centered on whether playing games increases players' literacy or not, and there is little consensus among scholars regarding the results of research on games and literacy. Steinkhueler et al. (2009) explored using digital games to increase the literacy of grades 6–9 students who were found to read at a substantially lower grade level than their own. The researchers found that by engaging in MMO games, paratext utilization and creation, and an online affinity group directed by researchers, participants were able to read and comprehend texts written at a grade 12 level. Furthermore, some participants scored much higher on reading assessments and demonstrated higher levels of engagement when utilizing texts related to digital games (Steinkhueler et al., 2009). However, some participants showed a complete unwillingness to engage in classroom activities and assignments that did not focus on digital games (Steinkhueler, 2010). So, while playing commercial games may have some benefits related to school-based literacies, even when played outside of school, it is crucial to delineate the difference between school-based skills and school performance: even if playing games helps students cultivate various literacies.

Gaming promotes the development of “soft-skills”

Examples of using a commercial off-the-shelf game for subject-matter learning are studies that use games to bridge barriers, focused on the use of massively multiplayer online games (MMOGs) as environments that support second language (L2) learning. A review of literature in the area by Jabbari and Zohreh (2019) argues that MMOGs are “low language anxiety” spaces that promote communication and socialization through the games' affordances. For example, an MMOG such as World of Warcraft (WoW) has opportunities for players to interact through text chat and/or via voice chat, and game play is supported by paratexts (WoW lore and background, forums, and fan fiction) and other resources such as game walkthroughs and live streaming of game play. The review concludes that “MMOGs encourage learners to get actively involved in L2 socialization and collaborative interactions with other PCs [player characters] to perform a variety of goal-oriented tasks within and beyond game contexts” (Jabbari and Eslami, 2019, p. 106). The point is that MMOGs are being used in educational contexts globally, to support language learning, with studies taking place in such places as Turkey (Alp and Patat, 2015), South Korea (Lee and Gerber, 2013), Spain (Rama et al., 2012), and the United States (Newgarden et al., 2015) in a variety of languages.

Digital literacies & digital games

Digital games have also been used to teach digital literacies both in and outside of the classroom. Increasingly, many career paths and educational systems require high levels of digital literacy. Gee (2012) refers to “premium digital literacies” or the “ability to use specialist/technical language connected to digital tools” (p. 419). While specialized digital skills may be gained in a variety of ways, coding, as we noted above, is one digital literacy that is highly valued in many career and educational institutions. O’Mara (2017) illustrates that students can begin coding as early as grade three, engaging with complex digital literacies through the context of game making. Making digital games also requires students to engage in collaborative learning and exercise school-based literacies like reading and writing as they create narratives for their games (O’Mara, 2017; Rowan, 2017). Introducing students to coding and digital literacy at a young age is especially relevant in efforts to diversify game development, where women and trans folks make up a very small percentage of workers and an even smaller percent of upper management (Edwards et al., 2014).

In addition to using commercial games as a tool and context of learning, educational games have also been created and studied in classrooms. Educational and/or serious games are classified as those meant explicitly for imparting information (Hawreliak and Lemieux, 2020). The exact definition of a serious game has been debated. For Michael and Chen (2006) it is a game that places learning over fun, and thus a serious game may or may not inspire entertainment. While mainstream games may give way to learning and address many significant topics, the possible learning outcomes are not explicitly addressed. Serious games, however, by Dörner et al.’s (2016) definition have at least one explicit learning goal. For example, serious games are: “a digital game created with the intention to entertain and to achieve at least one additional goal (e.g., learning or health)” (Dörner et al., 2016, p. 2). Such educational games take many forms and cover a range of topics such as vocabulary, reading, math, health, and geography, and are usually subject-matter specific. Children’s games may focus on traditional, school-based literacies and beginning digital literacies such as typing. Educational games, like dissection simulators, have been created to provide interactive environments for otherwise unattainable experiences in some schools. There are even some serious games that are created independently from educational institutions yet are designed with the aim to educate. These often revolve around critical social issues like gender dysphoria in Anna Anthropy’s *Dys4ia*.

The aim of serious games is to prioritize education over fun. Where traditional games may inspire impassioned learning, they are not focused on learning or learning outcomes, but rather entertainment and sales. One benefit of serious games is their ability to offer an embodied, simulated and interactive experience, that has learning entwined with play. Where students may traditionally read or watch movies about a topic, educationally focused games give them an opportunity to actively engage through modes unavailable in other mediums. In fact, serious games may be purposely monotonous, or emulate PCs’ powerlessness to give players a glimpse at the lived realities represented within the game. Director Luc Bernard discusses the intentionality of a lack of gamification and feelings of powerlessness in the upcoming game *A light in the darkness*, that follows a family of Jewish immigrants in France during 1942. *A light in the darkness* was created as an educational game about the holocaust in France. In particular, Bernard (2021) aims to highlight the seemingly small, compounding acts which led to the mass arrest of Jewish people in France in 1942. To emulate the powerlessness that Jewish people faced, all choices are removed from the player throughout the game. Players interact within their environments between many cut scenes, fulfilling the required tasks in order to progress. As Bernard (2021) describes some of these tasks, like registering with the police as a Jewish person, require compliance without resistance to those who seek to oppress or eradicate the player characters. In this way, the aim of the game is to create an immersive experience which can help players develop a greater understanding and empathy with the many people who were victims of the holocaust. To this emotional and psychological education is superadded the historical education of highlighting many of the real experiences and perspectives of holocaust survivors (Bernard, 2021). Digital games can offer perspectives and interactions unavailable through other literacies. Any lessons imparted are likely to be amplified through being actively experienced by the player in the form of their surrogate character, rather than through the more passive reception of traditional media. This is perhaps video games’ most powerful mechanic when considered as educational tools: if recited lessons are never as impactful as those learned from events personally experienced, then no medium, no other literacy, possesses as much learning potential as video games, for no other medium places the player/reader/learner in the active and volitional role of the character to whom these in-game event lessons happen.

Conclusion

Digital games modify and change the constructs that, in other domains, have been recognized as literacies. But the risk with all literacies, digital games included, is that we take analytical constructs and transform them into categories with prescriptions attached to them (i.e., you should do this, you need to learn this through playing a game). Instead, digital games allow us new ways of viewing what count as “literacies” that might also be useful for learning, understanding, for example, how games work not only at the level of code but as personally and socially formative, and as culturally processual. In other words, digital games can help us understand, much like literature before them, something about the cultural moments we are in, and who we are in those moments, or those experiences no longer available to us except through historical accounts. This understanding can be guided by the constraints and affordances that those digitally-enabled processes impart through play.

There is yet another way of thinking about the entanglement of literacies and video games; and that is, as we have hoped to show here, to engage with video games as a literacy practice akin to such traditional practices as the analysis of literature or poetry. From this perspective, video games would be approached not as one-dimensional products for entertainment, but from the critical

viewpoint deserving of a highly relevant and widely consumed creative medium transformative both through digital play and through digital design. As Jagoda (2020) argues, video games “constitute a unique medium for thinking through and affecting our historical present from the inside” (p. 219). To appreciate video games as sites of creativity, affect, critique, deep engagement, multimodality, play, and culture in the 21st century, inside or outside school walls, is to acknowledge video games as new tools for making meaning. The moment we find ourselves in, brings with it not only new literacies that demand innovative understandings of what those literacies entail, and how they might best be cultivated, but as well new opportunities for transforming how we use digital tools, including digital games, to help creatively and responsibly evolve pedagogy and learning.

Media and Information Literacy (MIL) is no longer the shrinking poor relation of more established literacies, due to major digital changes that emerged during the World Summit on the Information Society (2003–05) and were confirmed by the UNESCO Fez Declaration (2011). It recombines in new ways the relatively staid strands of media literacy and information literacy and comes in many guises, using low and high tech, often in extra-curricular activities and projects, in non-formal popular education settings. What is new is the need to twine those strands more closely and to integrate yet another dimension of information, data and its attendant algorithms as they drive social media and other upcoming immersive media. What needs to be done is to scale up MIL in curricular activities, in the formal education sector, with innovative pedagogical and research postures for future-proofing the XXIst century needs for a fully literate citizenry ready to face global uncertainties and crises.

What is lacking and what can be added to the current research is a change of focus, less on the skills and practices and more on the competences, finalities and values of such an education. What is also lacking is a full-fledged articulation of the notion of “information” with communication as it has evolved with digital convergence. This convergence enables mediatization (the ways in which networked media penetrate all cultural spheres) to mesh with documentarization (the ways in which all our records can be traced and interconnected) and datafication (the ways in which all our data transform and predict our social actions). The new challenges posed by globalization also call for a new restructuring of the notion of MIL, incorporating computing and documentation beyond the computer and library contexts to which they tend to be bound (Serres, 2012). For a clearer and larger vision of the issues at stake, this change of paradigm needs to propose theories for MIL that take into account its epistemological complexity, as a “transliteracy” (Frau-Meigs, 2012) responsive to the felt experience of most people in the digital culture. The Covid-19 pandemic has accelerated the awareness of such necessity to develop informational resilience among the public at large.

Definitions and epistemological diversity in global perspective

The field of MIL is made of sedimented accretions because of the extreme lability of media themselves. It has been theorized by stages, with early epistemologies organized around the triptych of production, representation and audience (Masterman, 1985; Buckingham, 2007; Potter, 2013), all calling attention to the socialization and social learning conveyed by media in society. The pedagogical postures have ranged from encouraging hands-on approaches and learning by doing with the media (Hobbs, 2010) to laying the emphasis on critical thinking and civic agency (von Feilitzen and Carlsson, 2003; Kotilainen et al., 2010; Carlsson, 2019; Kellner and Share, 2005). Such an approach has transitioned fairly easily to new media and social media with the adjunction of participation to the initial triptych focusing on production, representation and audience (Jenkins et al., 2006; Denouel et al., 2014; Jehel, 2014). But it has failed to embrace the full significance of information uses and practices and in particular disinformation, with the attendant social disorders of polarization and radicalization. The early euphoric view of the information networks as

“surfing” opportunities for an ever growing mediatization of society —attached to increased democratization worldwide—have failed to discern the “mining” risks of documentarization and datafication on media. This implies to revisit mediatization, documentarization and datafication in light of their impact on socialization and on MIL.

Augmenting communication: mediatization rebooted by the increased emergence of participation

The contours of media have shifted and impacted almost every aspect of human interaction, in most of the world, via the Internet networks and platforms. This has complexified “mediations” (Martin Barbero, 1987) as youth and adult lives are mediated by all sorts of media, including self-made media, like selfies or stories on social media like Instagram, Snapchat, etc. These pure-player media cohabit with pre-digital ones, with series and other long narrative forms that emerged on radio and television and are still quite alive, with extensions to videogames (Frau-Meigs, 2021c). The current media culture is striking by its enveloping multi-layered dimensions:

- It is multimodal with multiple affordances (uniting modalities of oral, print, (mass) media, participatory media to create remixed “texts” and “spectacles”);
- It is convergent and transversal (multiple platforms and settings, constant crossover, transmedia navigation, virtual environments, etc.);
- It is variable and multileveled (various points of entry, whether basic communication, mediated consumption, or complex levels of creation);
- It is ubiquitous, mobile and just-in-time (tethered selves and always-on amateurization of media production as an everyday reality);
- It is an immersive sensory environment with embedded learning affordances (how we take advantage of the learning capacities is key to media and information literacy) (Poyntz et al., 2020).

This complex ubiquity entails that these media formats have been enmeshed in other spheres of life, beyond entertainment, play and news, leading to “mediatization” that refers to the ways in which globalized and networked media penetrate the spheres of work, labor, trade, politics, religion and education and have a transformative impact on how these spheres operate (Hepp, 2013; Hjarvard, 2013). They also restructure them, with disruptive digital strategies that can displace whole economic sectors, as Amazon did to book retail first, before dealing with the whole retail sector and moving to online video streaming with Amazon Prime. The same could be said of Facebook or Google as social media and search engines are not just used for search and interaction but as gateways to all kinds of services (booking, buying, advertizing ...).

Mediatization processes show how media matter for cultural production and consumption but also for education and employment, as digital modes of communication can lead to direct actions on the real world. These new mediated processes require new mediated forms of socialization as they affect identity formation (Krotz, 2009; Erstad and Sefton-Green, 2015; Livingstone and Haddon, 2009), but also privacy, security and agency. They also affect citizenship as they enable participatory strategies that develop individual and collective engagement in public life (Kupiainen and Sintonen, 2009; Johansson and Hvinden, 2007).

Mediatization has affected representation and citizenship in positive and negative ways, affecting especially the notion of “truth” as sources of knowledge and information are being questioned by social media, with opinions painted as “alternative facts” competing with verified facts. The communication processes that have resulted from uses and practices point to societal issues with implications for democratic societies such as “fake news” and propaganda, echo chambers and filter bubbles, “narrowcasting” to specific audience segments known as “online communities” with trolling and astroturfing strategies. This has led to offline consequences such as the rise of populism, authoritarianism, radicalization and polarization (Tucker et al., 2018).

Mediatization has affected media literacy, as it needed to follow the media it examines critically. The augmentation of participation afforded by mass media and mass social media has added new competences to deal with the transmedia and transborder nature of the networks as well as “information troubles” (Wardle and Drekscham, 2017). Understanding online participation, with its opportunities for activism and civic engagement has become key (De Abreu et al., 2017; Mihailidis, 2018). New kinds of subjectivities have been taken into accounts, linked to emotions and cognitive biases and also to creative industries that require flexible, adjustable and mobile learners and workers, capable of acting confidently in a multicultural environment (Rizvi, 2009; Rizvi and Lingard, 2010; Frau-Meigs and Torrent, 2009).

Augmenting information: documentarization displacements

The contours of information have also moved in the digital era. Historically, it encompassed the production and referencing of (mostly paper) documents with a strong stress on their verifiability so as to ensure knowledge construction and transmission (Chartier, 1993; Goody, 1986). This early documentarization of the world used print formats as vehicles for cataloging, indexing and contextualizing documents to provide better access to their contents and to their context (Pédaque, 2007). The print formats have been displaced by digital files coming in all sorts of standards (word, pdf, ppt, jpeg ...). This re-documentarization entails both the digital treatment of old documents with the added functionalities afforded by ICTs (reconstruction, traceability, interactivity) and a different organizational process (search engines, online deposits, open sources, recommendation systems, online collections and archives) with record management and continuous updating via metadata. Thesauri and indexes have given way

to ontologies, “tags” and search engines, with attendant consequences on knowledge construction and transmission. The platformization of global search engines such as Google, Baidu, Bing, Yahoo! or Yandex testifies to the power of search, especially allied with navigators such as Chrome, Firefox or Safari as access points to a wealth of documents.

The construction, composition and publication of such documents have been made available to all thanks to networks and personal computers as they have become dematerialized and turned into distinct pixels (Salaun, 2007) that allow for the infinite transformation of documents, including their falsification. Wikipedia in many ways exemplifies this change, from an online encyclopedia of yore to portals and hyperlinks, curated by professionals and amateurs. Documentarization has also increased participation in the construction and evolution of such documents, with increased sociability and relational interactions applied to information sharing and curating. This has led to new practices of curation with tools such as Pearltrees, Pocket or Paper.li that have modified the order of recommendation, displacing the vertical gate-keeping of culture with a more horizontal peer-to-peer system (Serres, 2012). Participation has benefited from it with the immediate sharing of publications in the public space, and the confrontation of texts of all sorts to many others, visible by all sorts of viewers and readers (Salaun, 2007).

Documentarization has also affected democratic societies, potentially transforming humans as documents among many others (Ertzscheid, 2009). This prolongs the mediated identity formation (drivers license, identity cards, birth certificates, social security numbers ...) with a digital identity summed up by the collection of traces left by navigating, searching and browsing online. URL (Uniform Resource Location) and IRL (In Real Life) modes are both part of socialization and identity formation, be it voluntary or involuntary. It has led to information troubles of a different kind, due to the ease with which documents can be modified, morphed, falsified. It has contributed to “fake news” and disinformation, putting at risk scientific knowledge as well as documentation and library sciences.

Documentarization has also affected media literacy, as information literacy has been aggregated to it by various UNESCO initiatives such as the MIL Alliance or AMIL (ex-GAPMIL) since 2011. MIL brings together the potential of search and the potential of media, to encapsulate the necessary uses and practices of the social media platforms. It also aims at making more critical citizens, capable of assessing truth and trust, aware of the risks and opportunities of online publication and life long learning (von Feilitzen and Carlsson, 2003; Machin-Maestromatteo et al., 2013).

Augmenting code: datafication beyond computing

Datafication pushes mediatization and documentarization one step further, as much information is emanating from processed data. The traces left by search, navigation and other online interactions create a series of data that can be turned into big data and used to profile not only users but also actions. Datafication (Cukier and Mayer Schoenberger, 2013) is the transformation of social action into online quantified data, thus allowing for real-time tracking and predictive analysis. Once more, all spheres are touched, and invisible processes can be turned into data thanks to algorithms that can then monitor, analyze and most importantly optimize such actions. Data can thus be turned into information, via computerized processes that convert human interactions into new forms of value as data formats can be put to social, political and economical uses. Datafication is the source for the main business model of search engines and social media: psycho-metric micro-targeted advertising and can be used for propaganda and disinformation of the general public (Benkler et al., 2018).

Datafication affects socialization as social media platforms like Facebook or Instagram can trace friendships and use them to market other services (Casilli, 2008; Cardon, 2015; Boulrier, 2019). Less positive activities such as surveillance or social credit affect citizenship as well, with censorship, behavioral nudging or electoral manipulation via “fake news.” Netflix for instance moved from its core business in mail order, subscription-based video rentals (DVD and Blu-ray) to a full production system, with recommendations and global trending via its algorithm CineMatch that uses “machine learning” technology and a huge database to make its algorithms learn according to how users consume videos and to recommend to them what is “trending now.” Beyond recommendation systems, datafication is used to inform content, to train machines to behave like humans, for services in insurance, banking, social science research, that are increasingly managed by bots and metadata crawlers.

Datafication has an impact on socialization and identity formation because of the creation of the “quantified self” (Lupton, 2016) that does not necessarily bear resemblance with reality but generates metrics based on information provided willingly or unwillingly. Metrics are also connected to citizenship in that they show engagement. It prolongs human as documents with life mining options as data crunching becomes the norm. Even friendships are « datafied » via the « likes » of Facebook (Cukier and Mayer Schoenberger, 2013).

Datafication has also affected democratic societies, with deepfakes (AI-driven visual and audio content intended to deceive), dataveillance (undetected monitoring of users’ activities across platforms) and all sorts of privacy trespassing strategies (Van Dijck, 2014). This phenomenon is increased by the geopolitics of the internet as huge transnational companies protected by California law, but also increasingly Chinese law, shape a “platform society,” with the sense that they are organizing public and private life and cultural values (Van Dijck et al., 2018). Everyday life is modulated by the global ecosystem they create via algorithms and data, beyond virtual worlds (Srnicek, 2016). Beyond the pure player services they offer such as search engines and browsers, data servers and cloud computing, social networks and app stores, they also are operating other economic domains regardless of their nature as in the case of Uber (for taxis) or Airbnb (for hotels), with their own payment systems and engagement metrics. In so doing they often bypass national sovereignty. The platform ecosystem has incorporated mass media outlets and used its capacities to manipulate political situations, as revealed by the Cambridge Analytica scandal in 2017 (Manokha, 2018).

Datafication as *digital literacy* also reshapes the contours of media literacy. Often seen in contradistinction to computer sciences (focused on programming languages and informatics) it covers a more or less stable set of uses and practices in relation to digital tools and platforms, without necessarily understanding their design, their functioning and their finalities (Eshet-Alkalai, 2004; Wing, 2006; Baron and Bruillard, 2001; Drot-Delange and Bruillard, 2012). The core issues and key words become those dealing with transparency, accuracy, safety and privacy issues on the one hand and public good, social responsibility and democratic control on the other hand (Van Dijk et al., 2018; Frau-Meigs, 2021b; Van Dijk and Van Deursen, 2014). As they are not inscribed into the algorithmic processes operated by the platforms, they need to be imparted to citizens so that they are not treated as mere users.

The rise of literacy discourses

These three strands have each created an array of practices, pedagogies and policies that have led to many new literacies (Landry, 2017). Mediatization has led to news literacy, visual literacy, transmedia literacy. Documentarization has led to information literacy, search literacy, and datafication to digital literacy, algorithmic literacy, AI literacy. Globalization and the emergence of a global youth culture in connection to connected networks has also played a role in the intensification of literacy discourses and appended descriptors, instead of education discourses (Frechette, 2002).

This shift from education to literacy reflects the attempt at conceptualizing informal practices and uses that are not formally included in school curricula or integrated in official programs (Frau-Meigs, 2021b). Turning such set of practices and uses into a literacy has helped them penetrate the education sphere, as in the case of France where a report by the CNUM (2013), the National council on digital matters, opened the door for the imported term “littératie.” Frenchifying the term smoothed the path of resistance and shifted mindsets away from early discourses of cultural distinctions (Bourdieu, 1979) or class accommodations (Hoggart, 1957; Williams, 1958) associated with literacy. Some countries like the USA combine both, and deal with media literacy education (Hobbs, 2011), blending the ability to identify, interpret and create media contents with communicating and computing.

This shift conveys the pressure to respond to the needs of the platform society, as all sectors are pervaded with new workplace sets of skills, soft and hard (Hoechsmann and Poyntz, 2012; Frau-Meigs and Hibbard, 2016). MIL can thus be seen either as critically fostering such a set of skills or as catering and pandering to platform society requirements for subjectivities that are non critical of the new ecosystem. As schools are required to go digital and increase the digital competences of their students as future workers, so is MIL solicited to deal with values and concepts out of the instrumental realm, in a sort of division of labor (Fastrez and De Smedt, 2012).

So the literacy discourses are not neutral and reveal tensions in the field, around the necessity to “adapt” to the digital culture or to “cope” with it, at all costs for instance, that has technologically deterministic overtones. This can create confusion or chaos or even dilute the strength of MIL. But such profusion can also be constructive as the piling up of such literacies may finally shake the pre-digital school curricula current standstill and create enough momentum to break the status quo and allow MIL as part of the first curricula (Lee, 2020). It can also reveal the full scope of MIL as many shades of MIL are at work in diverse regions of the world from “educational communication” in Latin America (Aparici, 2010; Kaplun, 1998; Soares, 2019) to “multi-literacies” in the Nordic countries (Selber, 2004). The competing paradigms for learning show tensions between transmission (top-down knowledge acquisition in school institutions), co-construction (bottom-up development of competences via shared tools for mediation) and participation (horizontal and vertical circulation of knowledge within communities) (Frau-Meigs, 2012, 2017). The common goal remains the same though, fighting illiteracy and, additionally, illettronism that could be defined as the lack of transliteracy, with the cultural and digital divides that come with such lack.

At the international level, the tensions between these different forms of literacy are also at play, often in disputes over the articulation of computer sciences and ICT training, especially in schools where most countries have made the historic choice not to teach computing, except in optional and vocational sections. This has increased the gap between information as a science and information as a culture to the point that the hard sciences (physics, chemistry, maths, biology, etc.) tend to reorganize themselves around “information sciences” that exclude the humanities and therefore the political, social and economical dimensions of information cultures, most evident in the heavily adopted STEM initiatives. This rift has stalled the implementation of fully transliterate solutions. There has been no acknowledgment of effective uses, their representations in the users’ minds and their potential for creativity and empowerment, which could be seen as way of naturalizing digitization of society in a frictionless manner, without acknowledging the highly-media driven content and erasing the critical perspective on the evolution of ICTs (Frau-meigs, 2013, 2015).

Transliteracy as a frontier field: between pedagogy and policy

Defining transliteracy and its stakes

These three strands (mediatization, documentarization and datafication) are twined and are experienced as seamless by users in the practice of their everyday lives and experiences. A displacement in competences is visible that combines knowledge constructions and (self) representations with individual skills. Broad skills are needed for leisure but also for work and political participation; more specific skills are needed to deal with training and education within the new industrial frame of creativity and innovation (Drotner, 2011) that replaces the reproduction and transmission model of the pre-digital era in all sectors of society, via mediatization (Frau-Meigs et al., 2017).

This paradigm change requires researchers to revisit the territories of “information” as they are more and more closely related to datafication (computer literacy), documentation (information literacy) and communication (media literacy), where the term “information” gathers added meanings (news, documents and data). This move implies to spell out the double meaning of “transliteracy” in today’s context of convergence:

1. The ability to embrace the multimedia layout that encompasses skills for reading, writing and counting with all the available tools (from paper to image, from book to wiki);
2. The capacity to navigate through multiple domains that includes the ability to search, to evaluate, to test, to validate, and to modify information according to its relevant contexts of use (as code, news and document) (Frau-Meigs, 2012).

The rise of transliteracy itself is an emerging phenomenon, associated to the rise of literacy discourses. The term was coined by Liu (2012), director of the Transliterations Project in the Department of English at the University of California Santa Barbara (USA) and was focused on the practices of online reading. The same year Thomas et al. (2007) at the Institute of Creative Technologies (IOCT) at De Montfort University (Leicester, UK), founded the Production and Research in Transliteracy (PART) group, that focused on online writing practices. From its origins focused on English teaching the terme moved to embrace the convergence of communication, information and computer sciences, with the pioneering work of the research group LIMIN-R and the TRANSLIT project piloted by Frau-Meigs (2013). The emphasis was no longer on reading and writing but on the way the three information cultures required a fully-fledged set of competences for navigating the digital world (Delamotte et al., 2014).

The “trans-” prefix aims at conveying the notion that learning is “transverse,” that it is set across several domains, that are trans-media, transdata, transdocuments and even translingual and transborders, creating configurations that are sustainable though they may seem unlikely if each piece is taken separately. It allows for simulations, immersions, visualizations that can be learning events, produced in a non linear, non transmissive manner. The term also refers to digital popular culture and its “metaverse” (contraction of meta universe) a virtual world described in Neal Stephenson’s novel *Snow Crash* (1992). This virtual world created by a computer program, hosts a community of users who interact via their avatars, in anticipation of what would become Second Life (2003), one of the first online metaverses where, as in other virtual immersive environments people can work, play and learn. When applied to education, what is important to keep in mind is scalability (more and more people can aggregate to it, like a networked structure), usability (the user experience is central and has to feel friendly, like a relational good) and the prevalence of code and protocols to build architectures and interfaces and connected objects. Facebook’s decision to call itself META, in 2021, reflects the paradigm shift and the potential focus on participation added to education.

Defining and modeling transliteracy consists in adopting the convergence of three main types of literacies: media literacy, information literacy to which computer literacy is added for a full understanding of the techno-cultural constraints of the digital world. Its aim is to contribute to the construction of an analytical framework on the status of information in today’s culture, from the perspective of the communities of interpretation and practice that elaborate the three converging fields of information and library sciences, media and communications studies and computer engineering for social uses. Ultimately, this modeling process can help understand “information cultures” (not reduced to computer use). It can be of benefit to all researchers interested in the digital humanities as well as the communities of practice around young people (teachers, librarians, webmasters, ...) in their training and practice, on the basis that information and its communication are fueling knowledge development in the XXIst century (Salvador, 2019; Frau-Meigs, 2019b).

This hypothetical model was tested during the ANR Translit project, that was ground-breaking because of its transdisciplinary nature and its integrative purpose, taking learning events as they were in disjointed spaces (libraries, classrooms, virtual platforms) and conjoining them by looking at the seamless uses by young learners. This led to a construct for literacy with information at its core, within and outside schools, for social and pedagogical uses, with empowerment and engagement as learning outcomes (see Fig. 1). Three meta domains of competences were found: cultural and socialization competences for media literacy (or infomedia), organizational and editorial competences for information literacy (or infodocs) and operational and problem solving competences for data literacy (or infodata).

Within each of the three meta-dimensions, subsets for each could be broken down into a series of competences: criticism, citizenship, communication for info-media, search, publication and navigation for info-docs and protection, creativity and participation for info-data. Each of these competences can be implemented according to the four components of competences: skills, attitudes, knowledge and values. This framework for transliteracy, though elaborated separately, showed some overlap with the newly minted digital competences framework in Europe, that mention five major dimensions: information, communication, safety, creativity and problem solving (DIGCOMP, 2013, 2018, 2022). Unesco adopted a composite multi-faceted MIL approach not unlike transliteracy as “MIL constitutes a composite set of knowledge, skills, attitudes, competencies and practices that allow effectively access, analyze, critically evaluate, interpret, use, create and disseminate information and media products with the use of existing means and tools on a creative, legal and ethical basis” (2013). The notion remains that media cannot be diluted in the digital, because the convergence of mediatization, documentarization and datafication have to be thought per se, critically and creatively. Both may coexist, though they describe different realities and operate on different scales, but they both signal a paradigm shift. Transliteracy as the understanding of how the three information cultures are generated, processed, and packaged for audiences and communities provides a basis for mastering both the limitations and opportunities of the digital environment and acts as a foundation to use information, evaluate its relevance and contribute cogent contents and comments in the digital ecosystem.

Fig. 1 Transliteracy model: the three information cultures (Frau-Meigs, 2013).

Epistemology and core concepts and themes

Being aware of the centrality and of the inevitability of these literacies makes it possible to consider how transliteracy allows for a better knowledge of the processes associated to computer sciences, information and communication sciences and library sciences. Such a stance implies an analysis based both on the contents and their specificities (representations, formats, audiences) and on the processes and modes of access characteristic of data sciences (coding, storing and file-sharing, recommending, predicting). The operational and functional competences make it possible to understand the impact of technological design as well as the actors behind such design and the actors at the end process of this design, with their finalized needs and goals.

So transliteracy has a broad remit within MIL: responding to mediatization, documentarization and datafication, with key words that resonate with each other, beyond pre-digital notions while including them. So to initial core notions of production, representation, audiences and citizenship, others need to be added: participation, communities, networks, governance and creativity (see Fig. 2). These notions touch other boundaries, in the research on education sciences, youth studies, communication and

Fig. 2 MIL epistemology (Frau-Meigs, 2017).

information sciences and data studies. But what distinguishes MIL and transliteracy is the double axis of political project and pedagogical posture, in “a call to praxis, the fundamental demand that knowledge in the field orient to action in the world, the critical and creative act of responding” (Poyntz et al., 2020) ... and not just coping.

The new media and social media have reinforced participation and added this notion to representation, as well as they have added communities to pre-digital audiences. This more important place of participation has always been present in practical pedagogies and learning by doing scenarios but has been unleashed by interactive media forms and social media platforms. This has led to a “participatory culture” (Jenkins et al., 2006) with creativity and collaboration as key notions. Consequently, early notions of MIL such as protection from risks and safety have been less prevalent, though they are still present in the sphere of data privacy. Additionally online participation has created new conditions for civic agency, engagement and empowerment, encouraging citizens to take part in decision shaping and decision-making (Johansson and Hvinden, 2007). This has added an extra layer to the core notion of citizenship in MIL as citizens need to understand the construction of an array of subject-positions and expression of opinions because that globalization and transborder networks have loosened nationality and brought citizens to exert multi-level loyalties, to their self, their local community, their country, their region (Mäkinen, 2012).

The result is a rather holistic vision of MIL supported by transliteracy, with its recognizable epistemology or unique set of concepts and competences (see Fig. 3). A rapid synthesis of various existing competences frameworks shows that they can be summed up as the 7Cs: Comprehension, Criticism, Creativity, Citizenship, Consumption, Cross-Cultural Communication and Conflict Resolution (Frau-Meigs, 2012). The first three Cs are mostly found within schools while the four other Cs tend to be found outside schools. They reflect the MIL epistemology, with some competences aligning on pedagogy, some aligning on policy. They promote ethics and move MIL beyond current policies for IT or e-skills that are mainly operational. In a holistic manner, they recombine complex problem solving with technical, social and soft skills (Frau-Meigs, 2017).

Fig. 3 MIL as transliteracy and 7Cs (Frau-Meigs, 2017).

This set of constructs marks transliteracy as a frontier research with its characteristic paradigm shifts in phases of crisis, not unlike those of scientific revolutions (Khun, 1970). It deals with issues that are highly controversial, such as data privacy (mass surveillance, profiling, nudging), or online freedoms (hate speech, anonymity). It uses methodologies and concepts that are atypical in the general field of education but also in information and communication sciences. It challenges the dominant paradigms of schooling as transmission of knowledge only and breaks the fourth wall of the school and of the screen by allowing online expression and participation, with recommendation systems among peers and not just teachers. It shares with most frontier research the common feature of potentially transforming our understanding of knowledge construction and co-construction as well as identity formation.

Emergent themes and research areas

The new research themes that are related to transliteracy as frontier research call on knowledge and critical understanding of mediatisation, documentarization and datafication and their convergence. The field of MIL is very rich in resources with a praxis-oriented tradition, that is aligned with the felt needs of learners and users (Frau-Meigs et al., 2020, 2021). In spite of the rise of creativity and participation, issues of representation, production, reception and protection are still very much key, as a multiplicity of stories, selfies and series are broadcast via screens, as well as fake news that built on stereotypes to fuel polarization and hate speech. So production, language, audience and citizenship are still very much in need of critical thinking, with identity, gender and class as elements for dealing with disinformation for instance. But also new issues surrounding data, privacy and online well-being require critical and creative attention.

This moves MIL and transliteracy away from a mere understanding of “the press” (Gonnet, 1995) to learning about mass and social media as part of growing up in media saturated information cultures. New directions for research have emerged from the need to respond to crises and rapid changes while providing understanding and resilience, to resist anxieties and fears caused by excessive algorithmic surveillance and to clear democratic doubts caused by migrant crises, populism, social polarization and radicalization. The existential threat posed by climate change as well as pandemics such as Covid-19 also call for ways of nurturing innovation in research design and pedagogy.

The rise of the platform society and new consumption and protection competences

The rise of the platform society is affecting MIL in several ways, be it the understanding of the audiovisual fiction production line or the new consumption habits of globalized youth audiences. On the production side, research on Netflix as a paradigmatic company in the field of audiovisual creations, points to the way data and algorithms are used to predict the preferences of the audience (via Cinematch, Netflix’s algorithm). Many “over the top” (OTT) audiovisual platforms are configuring an “algorithmic taste” based on the mechanisms of Artificial Intelligence to mold and design contents supposedly tailored to consumer tastes and preferences (Halpin and Striplas, 2016).

This in turn affects culture and the control of the cultural and creative industries: a disruption of the pre-digital studio and network Hollywood-style system and the rise of “Hollyweb” with a different kind of control and power. On the surface it feels like more freedom of choices for users, under the surface more control and opaque processes that monitor users unbeknownst of their own will and act on their bodies, subjectivities and territories (Roberge and Seyfert, 2016; Gendler, 2016). Datafication is at work in this cultural change with new modes of perceiving the world and perceiving oneself (Van Dijck, 2014; Elmer et al., 2015), with questions about algorithmic recommendations and the future of audiovisual consumption, the degrees of freedom and conformity within algorithmic tastes and the opportunities and risks for audiences and their socialization to storytelling. A characteristic example is FOMO, the “Fear of Missing Out,” that points to the needs for social belonging (Przybylski et al., 2013) and the strive for being up to date in tendencies and recommendations that will also fuel conversations on social media.

Socialization is driving the reconfiguration of the GAFAM, as exemplified by Amazon’s acquisition of Metro-Goldwyn Mayer in 2021, to lay hands on a century long catalog of movies, hence proceeding to its redocumentarization. They are all striving to enrich their storytelling and their user-aggregated storytelling, each adding functionalities such as “reels” or “stories” to their social media. “Who owns what” is part of key knowledge for a better understanding of the future of communication and of cinema and audiovisual content, important for all to know as it may lead to improved competences in media consumption and algorithmic literacy. It becomes crucial to pay attention to traces, to navigation history and to cookies as well as requesting transparency in the collection of data and their uses by the GAFAM (Google, Apple, Facebook, Amazon, Microsoft) and the BATX (Baidu, Alibaba, Tencent and Xiaomi).

Information troubles and new participation competences

The rise of the platform society also impacts hard information, not just the soft socialization via fiction. Datafication and the mass sharing of news has led to information troubles (Wardle and Drekscham, 2017; Frau-Meigs, 2019a,c). The spread of disinformation has been connected to documentarization, with the fabrication and manipulation of authentic documents and contents in other

contexts, as exemplified by deepfakes, where faces and voices can be swapped from one body to another. Disinformation mechanisms prey on human biological, cognitive, and emotional biases that render citizens vulnerable to manipulation but they also play on publicity and the business model of social media that drives traffic for profit, based on the popularity of news rather than their quality.

Transliteracy can help raise levels of visual literacy and news literacy in the transverse dimensions of the Internet (transnational, transmedia, translanguages). It builds on critical thinking competences to consider how people make sense of information, how they understand the conditions of its production and amplification and how they are affected by disinformation, as it impacts their participation in democratic life and their trust in institutions, including the media (Ashley et al., 2017). Citizenship for empowerment and engagement is necessary for socially sustainable societies that can counter disinformation in day-to-day life and responsive to lived experiences (Boyd, 2017; Mihailidis and Thevenin, 2013).

Being able to discriminate various elements of the information factory and its attendant disinformation versant, implies to know about content, context and visual-image characteristics, and also about source (partisan sources, ingroup/outgroup sources), alongside characteristics of users (e.g., personality traits, values, prior knowledge/exposure, and media-engagement tendencies) and social norms (e.g., peers' reactions). This implies knowledge also of filter bubbles and echo chambers to better understand the role of online communities of practice (rather than audiences). These elements solicited transliteracy competences in critical thinking, but also conflict resolution as disinformation can lead to polarization and radicalization (Frau-Meigs, 2021b). Users thus need to realize that commercial media platforms are being used as de facto public spaces but without the public service obligations of public media.

Robust models to build informational resilience are also necessary as illustrated in project Youcheck! that associated a fact checking visual tool for journalists with inclass interventions in four European countries. It checked visual credibility and used advanced data science approaches to analyze the multicultural datasets in novel ways to build a quantitative model for fighting disinformation effects. Preparing interventions for students can be done by scaffolding strategies that enable them to access and assess credible news, so as to develop their competences in transliteracy, that is to say their ability to navigate between media, data and online documents, some of them fake, some of them accurate. The findings confirm that a 2 h intervention may have a significant effect on young people's abilities to determine the credibility of fake images and videos. They also show that sensitizing them to fact-checking tools changed their behavior as to their use to evaluate news credibility. Additionally, the intervention brought attention to image design and cognitive strategies such as lateralization in order to build heuristics for visual literacy among young people (Nygren et al., 2021).

Sustainability challenges and data governance competences

The two major crises of the XXIst century relate to sustainability and human well being. This points to focus of transliteracy on eco-media and on care praxis. It also points to governance reconsidered as it is about societal decision-making beyond governments, at global level, with multi-actors (Hajek and Wagenaar, 2003). The extensive use of epidemiological models during the covid-19 crisis and those used for systemic climate change provide a common thread for transliteracy, data-visualization, as a technique to describe the present and predict the future. Such models have been very active in the media with the "flatten the curve" injunction that evolved from it, showing that they do not only produce knowledge about complex systems, but they also frame societal decision-making.

Drawing the lessons from the disinfodemic that came together with the pandemic, a full information ecology is called for, to help solve environmental issues and foster sustainable development. Eco-media literacy (Rust et al., 2016; López, 2014, 2020) construes sustainability as environmental sustainability (weather reports, resource management, air pollution, etc.) and its public accountability which implies the need for open public spaces for the expression of all sorts of concerns for the future (climate change, digital pollution, migrations ...). Eco-media calls attention to the "anthropocene" (Crutzen and Stoermer, 2000; Chakrabarty, 2018), the recognition that humans have been modifying the environment with their mass of artifacts, including those needed to convey information like satellites, servers, clouds, screens, optic fiber cables and rare earth minerals (Maxwell et al., 2015; Walker and Starosielski, 2016).

Transliteracy can draw attention to the materiality of information and its ecological footprint as well as its mindprint, that is the representations about environmental issues as they are mainly constructed by media. Such constructs affect our beliefs and attitudes about climate change, with disinformation alleging that unlimited commercial freedom should not tolerate any regulation about the environment (Frau-Meigs, 2021a). Denying human responsibility is tantamount to « greenwashing », which has been apparent in advertising in particular and calls attention to the political economy of media ownership, as they rely on corporate ads or belong to large corporations, and promote unsustainable lifestyles.

MIL and transliteracy bring attention to the competences needed to decode such brainwashing, and engaging people's agency in not accepting seemingly innocuous metaphors such as "clouds" or "surf" that in fact obfuscate the reality of their polluting practices. Care, as the art of solicitude, calls attention to the needs for a full internet governance, with transparency, accountability, eco-justice and eco-responsibility in a networked society (Gilligan, 1982; Fine and Tronto, 2020). It produces robust counter-narratives to the current models of globalization that are exploitative and stifle the voice of indigenous people or young people, such as those expressed in the Fridays for Future (fridaysforfuture.org) movement (Redpath et al., 2018; Vieira and Tenreiro-Vieira, 2016).

These changes point to citizenship and how it is affected by data and its necessary governance (Brown and Katz, 2019; Brännback et al., 2017). Transliteracy can then rely on design thinking to embed its value systems in decision-shaping if not decision-making. It is paramount to understand how data can serve as evidence, and to make sense of different inferences from data, especially when they take the shape of predictive modeling or causal inference, that may sustain a critical discourse on future crises. This governance of data comes with care as data-based decision-making can create biases because that algorithms are editorialized by humans, with consequences on human rights and social justice, with populations at risk such as migrants or minorities that can be marginalized or discriminated against (D'Ignazio and Klein, 2020). Venues like the Internet Governance Forum (IGF) have stressed this need for competences in so called “digital education,” using policy-making with a high degree of inclusion of various stakeholders from the public, private and civic sectors (Frau-Meigs and Hibbard 2016). MIL has always relied on this multistakeholder approach to train and sensitize young people and adults to information cultures, creating a kind of governance from the bottom up, that is sensitive to rapid change and social innovation (Frau-Meigs et al., 2017).

Competences in rights and responsibilities online, activism for GDPR and facial surveillance, they all point to the fact that “the pedagogical is political” (Frau-meigs, 2021a). Mastering the proliferation of apps and immersive environments, as well as the robotic and prosthetic presence of non-human agents and connected objects is going to be essential to build a sense of community and well-being. This will not be the responsibility of individual users alone, but also of the platforms, to develop a sense of citizenship in a common planetary ecosystem.

Innovative research postures and methodologies: data sciences and cognition for transdisciplinary designs

Transliteracy affords many opportunities for theoretical and methodological developments that are much-needed in the area of converging literacies and in the face of rapid changes. Among the research questions, the issue of competences and their relation to the finalities of information search and use is crucial. Another key research question is the new collective dynamics, on the scale of the school and of the territory, that may be set up with the development of transliteracy in learning events with varied configurations, exploring the articulation between the individual and the collective, in the digital space as much as in the physical space. The political and educational options that might appear to reach a fully-fledged transliteracy are also key in education research, even in repurposing education around information multi-literacies as is currently being done in Finland (Palsa, 2020).

Transliteracy lends itself to transdisciplinary designs (not just interdisciplinary, between the social sciences), across social sciences and data sciences. There is much hope in evidence-based development of intelligent digital tools for assessing critical thinking skills and design experiments that iteratively scale innovations into practice. Such experiment was conducted in the YouVerify! project, where a Massive Online Open Course (MOOC) on “Disinformation Step by Step” was produced to scale up MIL contents, tools and pedagogical scenarios and make them available to participants at large (youverify.eu/).

Data sciences, in combination with cognition and cognitive neurosciences, belong naturally with transliteracy as it strives to clarify the relationship between data and media. Using datafication to conduct research on the rise of the platform society, information troubles and ecomedia sustainability is yet another manner to understand the way data function and bolster the mediatisation of society. For instance, the InVID plug-in used in YouCheck! and YouVerify! projects offers “metadata” tools and Social Network Analysis tools that not only help identify if images are fake or not but also how data are being used in disinformation and, in reverse engineering, to debunk disinformation. Such projects provide methods that can be effective for joint analysis of multidimensional behavioral and social patterns. They have already been used effectively with predictive models of susceptibility to the effects of disinformation (Hand, 2020; Mittelstadt et al., 2016; Vosoughi et al., 2018).

In this light, transliteracy lends itself to socio-cognition and cognitive neuroscience approaches as they shed light on socialization processes since they consider the learners’ interactions with their environment (including the media artifacts) and the multiplicity of interactions with their environment (Salomon, 1994; Perkins, 1995). Cognition posits that the learners are capable of articulating knowledge (content level) and pertinent information search (access, validation) in such a way as to construct their own understanding. Cognition comes in many shapes, like epistemic cognition that enables critical thinking (Greene et al., 2016), multiple source use (Verhoeven and Perfetti, 2008), and multimodal text and image processing (Leu et al., 2015). It takes into account the learners’ epistemic beliefs to build epistemic maturity, to turn information into knowledge and build a coherent representation of multiple texts (Frau-Meigs and Bossu, 2018). Techno-cognitive approaches are helping deal with disinformation and cognitive biases, with the use of smart AI-driven tools (Lewandosky et al., 2017).

Cognitive approaches also make it possible to deal with the emotional load of participation (Kahan, 2013, 2017; Kahne and Bowyer, 2017). Learning theories that describe mechanisms of how emotions and learning processes interact can be used to design those transliterate materials par excellence that are serious games. Although the literature on utilizing games to promote critical thinking is still sparse, research suggests promising results in this domain of gamification (Kapp, 2012; Sanchez et al., 2016). Games are undergoing a paradigmatic shift toward constructionist gaming in which students design games and generate game content for learning instead of just consuming games (Kafai and Burke, 2015; Moon and Liu, 2019; Shute and Sun, 2020). Participatory science can also be used for crowdsourced game content for instance (Lukyanenko et al., 2016). The Play Your Role project engaged in just such experiment to train young people to fight hate speech, with pedagogic itineraries that integrate cognitive and emotional solutions to support critical thinking and civic engagement (savoirdavenir.net/play-your-role).

Information troubles have pointed to the need to pay attention to images and emotions and how compelling they are in understanding their contribution to human development and cultural phenomena such as online series, selfies, streams and stories. Due to their high emotional charge, audio-visual messages seem to be more persuasive and more easily spread than textual content. Battling false visual information requires not only special attention and a new kind of information literacy but also automatic tools that facilitate detection of media manipulations. It implies the mastery of interactive visualization techniques in the face of prevalence of datavisualizations in media (Hohman et al., 2018). This could foster a rapprochement of the MIL community with the fact-checking community as they are developing image forensics with algorithms and smart tools to respond to the growing need to detect and prevent possible misuse of fake media content (Nygren et al., 2021).

Future of MIL and transliteracy for transformative education

In transformative education, learning involves the transformation of the learners' frames of reference (mindsets, worldviews) and the critical thinking and epistemic maturity to reflect on the learning processes even more than the educational outcomes and outputs (Mezirow, 1997). In times of crises and uncertainty, the need to project oneself and constantly update one's knowledge, seeing the strengths and distortions in one's emotions, re-assessing one's values and decisions requires "forwardance" (Frau-Meigs, 2015), the reasoned and agile use of the "affordances" (Gibson, 1977). To foster this forwardance, MIL as transliteracy needs to become part of the first curriculum and to be inserted fully in education policies at large, with proper scaffolding (Yelland and Masters, 2007).

Revisiting the school curriculum

In most countries, MIL is not part of the core school curriculum. It tends to be acknowledged as a cross-cutting topic, not even a discipline, sometime confused as online civics, to be appended to language learning or history classes. But with the rise of the platform society, information troubles and sustainable emergencies, such an approach is cracking at the seams, as MIL epistemology embraces new notions and themes. MIL needs to be both a transversal topic, just like reading and writing are needed for conducting math experiments or science tests, and a core topic per se, just as reading and writing are needed for basic literature and language learning. Only a trans-disciplinary approach such as the one afforded by MIL can help change the curriculum, with new core notions and fields of study around sustainability and information troubles, promoting a pedagogical posture that fosters learner-centered projects rather than top-down programmatic contents.

This decision is political because the risk of ignoring such changes may marginalize education via schools and precipitate education via platforms. Educational institutions need to develop their own platforms and networks, so that digital tools are not used with their current commercial missions, as discovered in the case of Zoom during the Covid-19 pandemic that turned out to have no policy for young learners' data protection, not complying with a certain number of international instruments with the best interests of young people and citizens in mind, such as the General Data Protection Regulation (GDPR). MIL can have structuring effects to help platformize education in an ethical manner, with teachers as influencers and students as active followers and content aggregators.

Putting MIL in the first curriculum, from primary to high school, is crucial to provide citizens with notions of credibility, authenticity, authority, accountability and transparency and for understanding information processes, data patterns, predictive algorithms and social network storytelling (Frau-Meigs, 2021b). Combatting information disorders and building informational resilience with quick healthy reflexes or heuristics for young people to alleviate their doubts about the credibility of a piece of information is as important as helping them use their creativity with their own series, selfies and stories. Critical thinking practices that involve using digital tools to solve problems and resolve conflicts by "learning by doing" and trial-and-error methods are key to forwardance and the care it requires to address issues of socialization and identity construction in relation to information cultures.

For doing so, the training of trainers is essential if schools want to scale up their curriculum to XXIst century subject matters. The lack of preparedness of the school systems at the local and national levels is hampering transformative learning and creating much frustration, among teachers as well as among learners. This requires to address the disconnect between universities and teacher training at large, as higher education plays a role in taking MIL to the school curricula. Currently MIL research and pedagogy tends to be conducted in theoretical fields that are outside education, in particular information and communication sciences and media studies, where it is considered as an ancillary domain to loftier topics such as political communication. Places like the Media Education Research section of the International Association for Media and Communication Research (IAMCR) have been building bridges to make this frontier field visible and remedy the situation. UNESCO, with its unitwin network of chairs in Media and Information Literacy and Intercultural Diversity (MILID) chairs, has pushed for a similar agenda. This has led to the production of MIL handbooks that try to offer constructs and inspirational narratives for MIL, to provide for its own storytelling legitimacy and testify to the vibrancy of the frontier field in many diversified settings and contexts, in intercultural dialog (Yildiz and Keengwe, 2015; De Abreu et al., 2017; Frau-Meigs et al., 2020).

Institutionalization of MIL and its risks

MIL is getting a fair amount of traction as countries are becoming aware of the disruptive and destructive uses of information troubles, as the covid-19 pandemic became a disinfodemic and a matter of public health and social justice. Due to the increase in information troubles and their impact on democratic societies, since 2018, but climaxing in the January 2021 US Capitol Insurrection and the banning of President Trump from social media, MIL is being institutionalized, albeit outside schools systems. For instance the European Union has incorporated MIL in DG-Connect, the division dealing with the EU digital agenda (rather than locating it in DGEAC, the division of education and culture). The 2018 Directive on Audiovisual Media Services makes it an obligation of the member states, in association with an event, European Media Education Week. The EU plan of action to combat online disinformation has led to the creation of the European Digital Media Observatory (EDMO) and 10 national and regional hubs. Additionally, social media platforms have been invited to promote MIL initiatives, which they have promptly added to their repertoire, as a kind of Media Accountability System (MAS) and a way of preventing state intervention (Frau-Meigs, 2019a). Facebook has created a chair for MIL research in the for profit Lille school of journalism in 2020. Google has provided 25 million euros for the MIL fund in the EU in 2021. However, encouraging social media platforms to get involved in MIL initiatives presents a risk of privatizing its public service mission with citizenship at its core.

Such institutionalization brings forth, reflexively, the issue of governance, ... applied to MIL itself. It draws attention to the need for frontier research in policy-making around MIL (Frau-Meigs et al., 2017). The tendency seems to be to use "sensible" practices to move fast, from the bottom up and capitalize on existing initiatives while promoting their larger diffusion and transfer, as in the case of Youcheck! and YouVerify!. The tendency also seems to encourage multi-stakeholder strategies and co-operation among social actors, including the for-profit sector, for providing many resources and materials. While being a positive sign of interest and diversity, the risk is the fragmentation of MIL in a myriad initiatives that can blur the need for a coherent competences framework and epistemology, if not diluting MIL into Digital competences frameworks. The role and emphasis of MIL in policies and the actors' positions in supervising and implementing such policies is therefore key to its capacity to effect transformative change in education. MIL governance should play a key part in public policy to ensure that its political project remains aligned with its pedagogical postures, in the public interest.

Conclusion

MIL as transliteracy can be seen as a rapid response to global changes and crises, not just as engagement with sustainability but also as forwardance, as an ecological manner of dealing with information cultures as they shape everyday life. From a rather ancillary and marginal area of non formal education it is emerging as a field that opens new horizons and new vistas to pursue, with enticing designs and experiments that have immediate consequences on people's experiences and attitudes. It can potentially help the education institutions transition effectively to fulfill the needs of the digital age, with ethics and values as part of the design. It also can contribute to education scholarship and development at large, with compelling notions and themes that shed new light on our ways of learning, as emotions, cognitive biases and multimodal texts and spectacles and stories drive the motivation to learn and to construct knowledge.

Introduction

Literature provides a space for readers to imagine and gain insight into the human experience. [Rosenblatt \(1938/1995\)](#) eloquently described literary engagement as a means of rich exploration, of “*living through*” (p. 38). Long before literary theorists and teachers of literature fully embraced reader-oriented perspectives, she argued for the role of literature in imagining the lives of others, examining our own lives, and tracing our responses back out into the world. As educators of literacy and children's literature, we similarly advocate fostering students' engagement with texts for young people, drawing on the wide array of critical literary perspectives that have emerged over the past sixty or so years. We find that critical lenses expand potential meanings, enrich classroom dialog, and offer students powerful tools for navigating the interrelated webs of real world and textual spaces. Reading literature through critical frameworks continues to be an exploration—perhaps an even more dynamic one.

Early on in a graduate course for prospective and practicing teachers, writers, and researchers of children's and young adult literature developed by the first author, we introduce critical literary perspectives by asking students what it might look like to analyze a picturebook using a variety of frames. We provide the class with a brief overview of selected key literary theoretical perspectives—beginning with the traditional lens of archetypal analysis, followed by more contemporary lenses, such as reader-response, cultural materialism, feminisms and queer theory, posthumanism, postcolonialism, and critical activist approaches. We then assign one perspective to each of several small groups of students, along with a copy of *Where the Wild Things Are* ([Sendak, 1963](#)). We ask each group to simply “play” with their assigned theory—without expectation of sophisticated responses. Invariably, however, we find that students are quite adept at rereading the picturebook through a critical lens, as illustrated in the following excerpted examples of their work:

Archetypal: From this perspective, we thought Max could be seen the classic hero—setting out on a quest, and returning transformed. The mother can be seen as the nurturer to whom he returns (symbolized by the warm meal waiting).

Feminist: Besides Max himself, we identified two “others” in this text, the wild things and “presence” of the mother. Max wears an androgynous wolf suit that could be seen as a rejection of the gender roles in his mother's house. When he goes off to the land of the wild things—a place where bodies, sexualities, and genders are unclear (e.g., long hair, phallic tails, no clothes)—notions of adult male heterosexual authority are disturbed. But he returns to the more normative gender politics of home.

Postcolonial: When we looked through this lens, we saw Max as one who goes out to conquer others. He becomes the ruler and the wild things are treated as others, as inferior, as less than human, possibly ascribed with some “primitive” qualities. We also saw themes of assimilation, yet with

a paradoxical sense of both helping and hurting in this line: "Oh please don't go, we'll eat you up we love you so."

Continuing in this playful spirit, we spend the remainder of the course embarking on a more in-depth journey of some of the literary lenses that are often applied to Children's (CL) and Young Adult (YAL) Literature in its various formats. For the purposes of this chapter, we selectively share these contemporary literary theoretical perspectives and the work of key scholars in the field to illustrate the richness of these approaches. Along the way, we offer up occasional examples of how we teach these lenses in order to bring into focus some of the key concepts illustrate our underlying pedagogical argument—that critical engagement with literature for young people can enrich and expand students' understandings of both texts and their everyday worlds. But first, it is important to situate this scholarship in light of the contested spaces of childhood and youth, and the slippery boundaries of the literature for and about them.

Contested borders: childhood, youth, and literature for young people

Critical approaches to analyzing literature for young people are inextricably bound to the contested borders of childhood and youth. Over time, competing Western models of childhood have shifted with changing attitudes, understandings, and values—from philosopher John Locke's notion of the child as a tabula rasa to Jean-Jacques Rousseau's vision of an unspoiled, more natural state of being. Central to these debates has been the shared acknowledgment that children are somehow distinct from adults, despite little agreement on what a child, or childhood, actually is (e.g., Ariès, 1962; Sanchez-Eppler, 2013). By the end of the 19th century, the English Romantic poets had fortified the symbolic child as vulnerable beacon of virtue amidst the corrupting influences of the industrialized world (Gubar, 2009)—a pervasive figurative link between youth and innocence still seen today (Aitken, 2001).

The 20th century continued to reshape how children and young people are perceived and studied. Early on, Piaget's (1970) theory of development conceptualized childhood as a sequence of stages—a linear "temporal passage" culminating in adult rationality and autonomy (James and Prout, 2015; Venn and Walkerdine, 1978). Later critiques of developmental models opened up more culturally-situated paradigms (Duane, 2013). Interdisciplinary scholars within the then emerging field of childhood studies retheorized childhood as a complex, contradictory social construction that varies across cultures and historical eras. They also began to question the ambiguous borders of adolescence—the liminal period between childhood and adulthood (James, 1986) described by psychologist Hall (1904) as a rebellious time of "storm and stress" (p. xiii). By the 1990s, adolescence—like childhood—had emerged as an equally elusive and fluid category, encompassing a range of experiences of degrees of independence (Lesko, 2012).

Despite these shifts, Romantic constructions of innocence remain at the heart of debates over childhood and youth. The presumed causal relationship between loss of innocence and increased experience as one transitions from child to adult is still widely used as justification for the watchful maintenance and policing of childhood borders (Marshall, 2012). Moreover, these discursive constructions of youth—those that are often sustained by and in children's literature—tend to limit the normative bounds of innocence to a "White, middle class, and heterosexual" (Marshall, 2012, p. 298) frame.

Boundaries of literature for young people

The history of children's literature has been similarly troubled by a "lack of definitional consensus" (Hintz, 2020) and disputes over what children's literature does, who it is for, and what form and content it presents to readers (e.g., Gubar, 2011; Nodelman, 2008). By the early 20th century, Anglo-American children's literature had blossomed as a profitable niche market and professional field, in part due to the growth of print culture, juvenile divisions of publishing houses, and the popularity of playful (as opposed to didactic) texts purporting to serve the needs of actual children (e.g., Demers, 2009; Mickenberg and Vallone, 2011; Postman, 1982).

Yet as childhood studies and children's literature gained scholarly traction in the 1980s and 1990s, critics began to challenge the fundamental notion that the child was a universally identifiable consumer marked by playful innocence (e.g., Higonnet, 1998; Kincaid, 1992). Perhaps the most influential of these literary censures came in 1984, when Jacqueline Rose asserted that children's literature was "impossible." Whereas child-centered narratives were widely assumed to represent, know, and speak to and for children, Rose argued that children's literature was instead fueled by adult agendas and desires—thereby casting the child "as an outsider to its own process" (Rose, 1984, p. 2).

Rose's contention has since prompted scholars to reckon with how children's literature is defined, regulated, and censored by adults (e.g., Clark, 2003). Some scholars maintain the impossibility of defining it in the first place (e.g., Rudd, 2010). Others, such as Nodelman (2008) and Hunt (2005b), concede the situated cultural meanings of children's literature while still seeking to generalize its unique features. As Hunt (2005b) maintains, children's books "are written for a different audience, with ... different ways of reading; equally, children experience texts in ways which are often unknowable, but which many of us strongly suspect to be very rich and complex" (p. 3).

The disputed bounds of CL likewise infuse definitional borders of YAL. However, debates over innocence and youth play out differently when applied to adolescents and, in turn, the literature marketed to them. While innocence as a childlike attribute exemplifies earnestness and asexuality, innocence in the adolescent sphere is related to conceptions of youth as a time of precariousness and vulnerability that may require guidance, monitoring, and regulation (Marshall, 2012).

These competing views of what constitutes childhood, adolescence, and children's and young adult literature inevitably influence what kinds of texts are produced for young audiences, how that literature is read, and how various literary theoretical perspectives are applied to those works. While this chapter presents some of the ways in which scholars have approached these literary spaces, our review of theoretical lenses and their applications to children's and young adult literature is necessarily selective. For example, we begin in the latter half of 20th century, when examinations of literature for young people shifted to include discussions of readers and cultural discourses and practices. As educators, we also tend to underscore how literary perspectives can deepen the practical ways in which teachers, librarians, and writers explore texts with young readers. Most of all, we are invested in how children and adolescents themselves imaginatively engage with, resist, and negotiate literary worlds in relation to their own lived experiences.

Critical literary theories

Critical literary perspectives are as old as philosophy, religion, and literature. However, it wasn't until the 20th century that literary theory became a profession separate from philosophy, largely adopting secular literature as its subject. In the West, early approaches to modern literary analysis were often structural in nature. These included archetypal analysis, exemplified by Frye's (1957) *Anatomy of Criticism*. Drawing on the work of psychological Carl Jung, Frye (1957) argued that specific literary archetypes connect one literary work to another. Frye identified children's literature in particular as having a common archetypal pattern, in which characters embark on and emerge from a transformative adventure (Nodelman and Reimer, 2003). By the mid-20th century, other approaches, such as New Criticism, grew in popularity—effectively reshaping how literature was read in schools. New Criticism emphasized the connection between the structure and meaning of literary works. Proponents argued that literary studies should focus solely on the text—not on the responses of readers, the author's intention, or any other historical, cultural contexts (Wimsatt and Beardsley 1946, 1954).

By the early 1970s, literary theorists had begun to shift away from structural approaches toward various reader-oriented frameworks instead (e.g., Jauss, 1970). Educational researchers likewise began drawing upon “response to literature” perspectives (Purves and Beach, 1972; Purves et al., 1990); the Dartmouth Conference in particular noted the role of personal expression in literature classrooms (Dixon, 1967). Reader-response perspectives came into fuller prominence later, with the publication of Tompkins' (1980) anthology, *Reader-Response Criticism: From Formalism to Post-Structuralism*, in which contributors (e.g., Bleich, 1978; Fish, 1980; Iser, 1978) turned to readers and their readings as the primary source of meaning. As Tompkins (1980) argues in her introduction, reader-response is not a unified theory, but a collection of post-structural perspectives focused on the interplay of meaning in texts. Despite internal disagreements among reader-response critics, Tompkins (1980) notes, “they are united in one thing: their opposition to the belief that meaning inheres completely and exclusively in the literary text” (p. 201).

In our own course, we often begin discussing this shift from structural or text-oriented approaches to more reader-oriented perspectives with a reading of Williams' (1938/1991) imagist poem, “This is just to say.” Inevitably, our students approach the poem with a variety of tools and frameworks. Many seek examples of symbolism—since that is so often what they have been taught to do—but they also bring their experiences, their appreciation of the imagery, and their sense of the ironic tone (a noticing that often leads to conversations about reading from a gendered or cultural perspective). Through this exercise, we illustrate the many reader-based strategies that guide interpretations of literary works; Williams' poem facilitates a brief glimpse into the myriad ways individual readers make sense of even the smallest of texts. Following this reading, we share a brief history of reader-response theories, from the seminal literary and educational scholarship drawing on Fish (1980) and Rosenblatt (1938/1995) to more contemporary research that takes into account a broader range of texts, cultures, and communities.

Reader response theories

Fish's reader-oriented perspective, articulated in his now well-known work, “Is There a Text in this Class?” (1980), rejects the text as the primary source of meaning in favor of readers. He notes that the play or instability of texts and meaning is not worrisome given the constraints on interpretive strategies or approaches available to readers in any given “interpretive community;” our common beliefs and practices about how meaning is created results in ample amounts of shared meanings. While this view that meaning resides with readers resonated with studies on the psychology of reading and the earlier work on response to literature, it was also a clear rejection of the work of the New Critics and their focus on textual interpretation.

Along with reader-response critics, literary theorists who had long understood this phenomenon were rediscovered around this time, most notably Rosenblatt (1938/1995, 1978/1994). Rosenblatt focused not only on the reader's meaning making, but also on the rich interactions (what she called transactions) between readers' whole worlds and what Tolkien (1964) called the “secondary worlds” of literary texts. Her work memorably evokes a sense of reading as the creation of a dynamic, alternative reality; through their active participation or performance in the alternative worlds of texts, readers co-create “the poem” that results (Rosenblatt, 1978/1994).

The confluent rise reader-response theory, response to literature, and cognitive psychology also reshaped the focus of educational theory and instruction (Rogers, 1999). Key educational studies in the 1980s and 90s drew on reader response theory to examine the dynamic ways in which readers enter and engage in the secondary world(s) of literary texts (Benton, 1983; Enciso,

1992; Galda, 1982) as well as the ways readers (re)construct those worlds both inside and outside of classrooms (e.g., Many and Cox, 1992; Sipe, 2000). A new generation of qualitative response studies (e.g., Hickman, 1983; Hynds, 1989; Rogers, 1991) explored how instructional contexts and discourses create various interpretive spaces for students' responses to literature (e.g., through conversation, performance, art, and writing).

Reader-response criticism has similarly influenced scholarship on how young people engage with visual texts, such as picture-books and graphic novels. Sipe (1998) and Low (2012) draw on Wolfgang Iser's theory of the gaps in literature, along with social semiotic theory (Kress and Van Leeuwen, 2006), to explore how words, images, and other visual features (e.g., gutters and panels) work together to influence meaning making. Drawing on those same frameworks, Styles and Arizpe (2001) provide a particularly striking example of how a range of young readers employed a sophisticated visual grammar to read, across gaps and images, the emotional and visual subtleties of Browne's 1992 picturebook, *Zoo* (see also Arizpe and Styles, 2016). Related work on reader responses to visual texts continues to flourish with multimodal and digital turns in CL and YAL, together with shifts toward post-modernism and popular culture perspectives (Pantaleo, 2008; Serafino and Pantaleo, 2022).

By the 1990s, much of the work on reader-response criticism in education began to give way to cultural perspectives (e.g., Rogers and Soter, 1997). In recognition of the diverse interpretive communities within classrooms—and the influences of cultural backgrounds and perceptions in the process of meaning making—scholars focused more on how cultural discourses circulate across texts and readers, taking into account issues of power and systemic social inequity. As Marxist critic Eagleton (1983) argued, interpretive communities are actually sites of struggle, wherein “certain meanings are elevated by social ideologies to a privileged position” (p. 132). While readers within communities may draw on previously learned conventions of reading and writing, they also are situated culturally (e.g., along race, class, and gender lines; Rabinowitz, 1987)—taking up various or even contradictory identity or subject positions. As such, many CL and YAL scholars began to look to cultural and political perspectives in their analyses of literary works and how young people engage with these texts.

Cultural studies and cultural materialisms

The origins of cultural studies can be traced back to the work of theorists such as Hoggart (1957), who studied literacy as part of a larger network of life practices that could not be separated into “high” and “low” culture (Williams, 1958). In applying this to literature, cultural studies theorists take the perspective that literary works exist within vast network of cultural texts and are not necessarily accorded higher status than, say, a newspaper. Rather, all texts and authors construct and reflect political and cultural meanings. This perspective also reveals literary canons as social and cultural constructs, reflective of the tastes and influences of dominant groups. It would be unwieldy in this space to try to capture all the different strands of cultural studies and cultural materialisms (e.g., New Historicism, Marxist perspectives, the works of The Frankfurt School, British Cultural Materialisms, American Multiculturalism, and Foucauldian theory), so we focus on just a few.

For instance, Marxist literary perspectives, like feminist perspectives (as we discuss in next section), interrogate texts for underlying ideologies related to material inequality and social reality. They link reading with raced, classed, and gendered processes that cannot be fully understood in the absence of analyses of power and privilege. Marxist perspectives examine the ways divisions of labor lead to inequities, inevitably toward revolution. They raise questions about values, relationships between the fate of individuals and societies, and the dialectics of morality and social justice. Zipes (2002) applies Marxist historical materialism to fairy tales by locating their origins in political, class-based struggles rife with exploitation, hunger, and injustice—as well as the human drive to remake the world. It is only when the tales are appropriated by upper class and bourgeois writers, he argues, that they begin to reflect more conservative views (Zipes, 2002).

Cultural literary theorists have also drawn on the writings of Michel Foucault. Though Foucault himself resisted being defined as poststructuralist or postmodern (he openly criticized Marxist theory), his work often echoes Marxist critiques of social structures—linking ideologies to social relations and systems of power. However, inconsistent with Marxist tenets, Foucault believed such change occurs in smaller increments over time, stemming from localized forms of resistance and rupture rather than large-scale revolutions. As he outlined in *Discipline and Punish* (Foucault and Sheridan-Smith, 1979), individuals are spatially and behaviorally regulated and disciplined (i.e., into subordinate, “docile bodies,” p. 135) through institutional and discursive methods of surveillance and punishment. In effect, read through a Foucauldian lens, subjectivities are produced through discourse—though individuals still possess the agency and ability to resist.

With the students in our course, we examine how Foucauldian discourse analysis has been productively taken up by CL and YAL scholars to examine how dystopian works in particular produce ways of thinking and speaking about the child and adolescent in society. Latham (2004), for instance, provides a Foucauldian reading of *The Giver* (Lowry, 1993), tracing the tension between community surveillance and individual resistance to power in the novel as well as highlighting the ambiguity of its ending. Connors (2017) draws on Foucault's concept of the all-seeing Panopticon to analyze *The Hunger Games* (Collins, 2008)—a core text for our course that we use to explore many of the key literary perspectives that follow. Equating Panem with the Connors (2017) argues that the potential of resistance lies within characters' everyday tactics (de Certeau and Rendall, 1984) and subversive acts (see also Hubler's 2014 historical materialist readings of Collins' novels).

These rich perspectives offered by cultural studies and cultural materialisms on the ways ideology and power inhere in texts form the basis of many other critical perspectives on CL and YAL, including the various theoretical underpinnings for feminist frameworks, readings of gender and sexuality, and posthumanist, postcolonial, and critical activist approaches.

Feminisms and children's literature

The revolutionary work by feminist theorists, critics, and writers beginning in the late 1970s (e.g., Gilbert and Gubar, 1979; Heilbrun, 1973; Showalter, 1985) gave rise to the scholarship on the politics of gender and representation applied to children's literature today. Throughout that formative decade, feminist theory gained traction in the US and Europe as readers and critics began to "resist" (Fetterley, 1978) the ubiquity of conventional gender representation in popular texts, particularly in Grimm, Anderson, and Perrault fairy tales (Lieberman, 1972). Writers and illustrators such as Margaret Atwood, Jane Yolen, and Angela Carter took up this revisionist mantle as well, publishing so-called fractured fairy tales and retellings that sought to destabilize the textual perpetuation of patriarchal systems, beliefs, and practices (see Zipes, 1986).

Many have discussed how these early retellings did not so much change gendered scripts as merely reverse them with superficial alterations (Davies, 1989; Paul, 2005; Trites, 1997), such as switching the protagonist from a hero to a heroine. Consequently, Paul (2005) writes, the ostensibly empowered female heroines of the 1970s and 80s "tended to be more like men tricked out in drag" (p. 120). Moreover, revisions of popular fairy tales tended to center on white, cisgender girls and their cisgender male counterparts, mirroring the common critique that second wave feminism was singularly concerned with the plight of white, heterosexual middle-class women (Marshall, 2021).

We use such contentious fairy tale retellings to broach the topic of gendered cultural discourses in our course, focusing on variants of *Little Red Riding Hood* (based on the Perrault and Grimm versions of the tale). Trina Schart Hyman's romantic 1983 retelling of the Grimm version, for instance, privileges discourses of femininity that value obedience and morality: Little Red coyly vows she will "never stray from the path again." In contrast, texts based on the Perrault version tend to emphasize his more cautionary tone. While Coady (1991) creates an ominous world of shadows and claustrophobic framing, Montresor (1991) jars readers with gruesome, wordless illustrations of Little Red entombed in the wolf's bloated stomach. Moon's (2002) urban photo-essay is even more explicit, starkly visualizing, in black-and-white, a Little Red rape narrative. As we explore these retellings with students, we discuss the nuanced, contradictory, and interrelated discursive bounds of girlhood, sexuality, innocence, and violence.

By the late 1980s and early 1990s, children's literature scholarship had blossomed beyond fairy tales to examine how a range of classic and contemporary CL presented grooming sites for "gendered selves" (Davies, 1989, p. x). Work by Vallone (1995), Higgonnet (1998), and Beverly Lyon Clark (e.g., Clark and Higgonnet, 1999) sought to peel back the seemingly innocuous veneer of dichotomous gender constructions in children's texts and material culture. Black feminist theorists and writers had expanded literary feminist analyses to embrace the intersections of gender with other facets of identity, such as race and class (e.g., Hooks, 1992). Influential work by postcolonial theorists (e.g., Spivak, 1988) increased scholarly attention to how normative constructions of gender also interconnect with those of race and power in texts for young people. For example, in their respective mappings of the Victorian "golden age" of Anglophone CL, Reynolds (1990) and Nelson (1991) reveal how immovable constructions of gender and childhood lay at the heart of White colonialist societies.

As feminist readings began to more closely align with the broadening field of gender studies (see Butler, 1990, 1993), new strands of scholarship explored how children's literature contributes to the fluid and relational delineations of multiple gender identities and expressions. Butler's (1990) transformative notion of performativity reconceptualized gender and identity "as something that we 'do' rather than 'are'" (Mallan, 2009, p. 5)—sparking investigations into how gendered subjects are produced or resisted through literary representations. Coupled with a renewed focus on embodiment in texts for young people (Nikolajeva, 2016), such work laid the foundation for queer criticism and interrogations of gender, sex, and sexuality. As Trites (2018) notes, by the turn of the 21st century, children's literature scholarship approached gender as an interplay of "discourse, performance, and the material" (p. 142)—inviting examinations of presumed cis- and heteronormativity in texts for young people.

Gender, sex, and sexuality

Building on influential work by Butler, queer theorist Sedgwick (1985, 1993), and discussions of sexuality, innocence, and desire in children's literature by Rose (1984), Higgonnet (1998), and Kincaid (1992), early queer readings of children's and adolescent literature uncovered the largely ignored presence of gender and sexuality in classic texts. In his role as guest editor for the 1999 edition of the *Lion and the Unicorn*, Kenneth Kidd memorably noted how "sexuality seems to be virtually everywhere in children's literature and media" (p. v), inviting scholars to "hold open the speculative space of sexuality as well as gender, think carefully about the place of race, class, and national identity in that space, and see what we learn" (p. vii). Key to this opening for queer and trans criticism of CL and YAL was muddying cultural divisions between adults and children, maturity and innocence, as well as contentions that sexuality serves as the dividing line between children's and young adult fiction (see Coats, 2011).

For instance, citing scholarship on childhood queerness (Bruhm and Hurley, 2004; Stockton, 2009), Pugh (2011) noted the complex portrayals of sexuality found within popular children's texts, from the Oz (Baum and Denslow, 1900) series to *Harry Potter* (Rowling, 1997). Much of children's literature carries what Pugh (2011) termed an "inherent paradox"—a tense endorsement of both sexual innocence and heterosexuality for its implied child reader. Other queer readings have focused on recognizing the rich albeit unacknowledged history of gay, lesbian, queer, and trans representation. While Kidd (1998) maintains that the emphasis on homosocial relationships in classic American fiction is "decidedly queer" (p. 114), Abate's (2008) explorations of tomboyism trace the cultural evolution of gender-nonconforming characters in texts like *Little Women* (Alcott, 1868/1983); see also Abate and Kidd (2014).

As queer representation in CL and YAL arguably became less ambiguous in the 1990s and 2000s, queer readings also began to focus on identifying to what extent certain patterns and tropes either destabilize or reinscribe hegemonic categories of gender and sexuality. Intersectional feminist, queer, and trans scholars note how children's and young adult literature have long been used as pedagogical tools, instructing youth, parents, and educators on issues of gender, sex, and sexuality (Mallan, 2009; Trites, 2000). As such, new novels can contribute to the increased diversity and complexity of representation—or reify assimilatory norms and values. For example, picturebooks purporting to represent rainbow families for young readers, such as *Heather Has Two Mommies* (Newman and Souza, 1989), have been critiqued as conforming to heteronormative tropes of White, middle-class suburbia (Mason, 2020). According to Taylor (2012), such texts celebrate queer families—as long as they visually and behaviorally reflect “homonormative” standards.

Scholars have similarly observed how the explosion of YAL in the early 2000s featuring LGBTQ+ characters and plotlines mostly still adhered to a conservative YA “coercive tradition” (Kokkola, 2013, p. 5) of punishing or demonizing adolescent sexuality. These issues continue to be especially fraught for trans characters; as Mason (2021) notes, despite the increase in trans representation in North American texts, the dearth of more global and non-Eurocentric trans and genderqueer childhoods in literature still pose challenges to decolonizing efforts in this field. Pini et al. (2018) further underscore how even when trans characters are central to North American texts—as in Katcher's (2009) Stonewall Award-winning novel, *Almost Perfect*—heteronormative, cisnormative, and transphobic perspectives persist as the default and acceptable positions.

Nevertheless, in recent years, scholars have also looked to CL and YAL for hopeful if not idealistic visions of queer figures, spaces, and communities. While some have considered the potential for intersectional queer futurities (e.g., Matos, 2019; Pattee, 2008), others have explored how queer and feminist approaches might interrelate with those of posthumanist lenses (Flanagan, 2011), moving away from post-structural criticism to embrace posthuman ontologies of being.

Posthumanism

Posthumanism is one of the later topics we cover in our course, as CL and YAL scholars frequently combine posthuman lenses with other critical frameworks including feminisms, ecocriticism, and critical disabilities studies. The “post” in posthumanism signals its ontological break from longstanding humanist conceptions of humans as self-contained, exclusive, and bounded (Nayar, 2014). Rather than privileging human subjectivity, posthumanists seek instead to disrupt biological and social hierarchies—focusing on the interrelated, dynamic agencies of organisms and that flow through complex systems and networks (e.g., Pepperell, 1995; Wolfe, 2009). In this way, posthumanists share ecocritical and critical disabilities notions of human minds and bodies “becoming-with” discursive and material worlds (Haraway, 2008); the human is seen not as exceptional or dominant, but instead as interconnected in body, behavior, and mind to other species and the environment (Tarr and White, 2018).

Much of the critical posthumanist approaches to children's literature draws on work by Haraway (1985, 1991, 2003) and Braidotti (1994, 2013, 2019) to explore issues of embodiment and hybridity. Those building on Haraway's (1991) feminist exploration of the positive transgressive potential of cyborgs have focused on the “unstable body of the adolescent and the hybrid bodies of monsters, cyborgs, and other ‘nonhumans’” (Harrison, 2018, p. 7) featured in YA dystopias, science fiction novels, and children's picturebooks and fantasy texts (e.g., Hintz et al., 2013; Jaques, 2015). Many of these scholars have also detailed how contemporary CL and YAL often serve to underscore the destructive potential of technological advancement, depicting the posthuman body as a site of fear (Kokkola, 2018). Ostry (2004) maintains that cyborgs in YA science fiction dystopias such as Anderson's (2002) novel, *Feed*, Westerfeld's (2005) *Uglies* series, and Dickinson's 1988 *Eva* ultimately emphasize the dangers of bioengineered, mechanistic futurities. By satirizing and demonizing the mechanical Other as freakish, unnatural, and artificial, such texts can reify fixed assumptions about the superiority and innate qualities of humans (Jaques, 2021).

Posthuman approaches to CL and YAL thus delve into tensions and cultural anxieties about the murky, unregulated bounds of cyborg futurities. To explore these common, wavering uncertainties in texts for young people with our own students, we pair this lens with a rereading of *The Hunger Games* trilogy (Collins, 2008, 2009, 2010), considering how the figure of the mockingjay in particular might exemplify a posthumanist blurring of human, animal, and machine. As Guanio-Uluru (2017) argues, the mockingjay shifts in symbolic significance as the series catalogs the varying political and social implications of hybrid beings—vacillating between an emblem of love, hope, and loss to a source of destructive, militaristic power.

Other scholars focus more decidedly on the liberatory potential of posthumanist subjects in both classic and contemporary CL and YAL, borrowing from Braidotti's (1994) Deleuzian construction of the nomad (e.g., Flanagan, 2014; Reynolds, 2007). Entities conventionally thought of as nonhuman (e.g., inorganic materials, plants, environments, animals, and toys) thereby become textual sites of embodied and conceptual leakage, signaling opportunities for reinvention. As Tarr and White (2018) argue, posthumanism is “not so much anti-humanism as it is a re-envisioning” (p. xvi)—opening up new possibilities for conceptions of childhood, adolescence, and adulthood.

For instance, in her readings of robots and toys in children's texts such as *Winnie-the-Pooh* (1926) and *Pinocchio* (1883/1996), Jaques (2015) notes that toys not only trouble the boundaries of being, they also expose the artificial bounds of humanity itself. Similarly, disputing Ostry's (2004) readings of contemporary YA science fiction, McCulloch (2016b) notes how Revis's (2011, 2012, 2013) *Across the Universe* trilogy offers “a hopeful empowerment of adolescents that can inspire tomorrow's citizens to form ethical and empathetic relations with others” (p. 75). Contending that posthuman texts invite multiple boundary crossings and queer readings, McCulloch further describes their transgressive potential to rupture parameters of race, ethnicity, sex, and gender in defiance of

globalized hegemony (McCulloch, 2016b). This activist reading of the posthuman has been similarly embraced in recent years by numerous scholars who meld posthumanist frameworks with other critical approaches to embodiment, subjectivity, culture, and the environment, particularly through feminist, queer, and, as we discuss below, ecocritical lenses (e.g., Duckworth and Guanio-Uluru, 2022).

Postcolonial theory

To introduce postcolonial theory in our course, we ask students to read the graphic novel, *Pemmican Wars* (2017), by Métis writer Katherena Vermette—the first volume in her series, *A Girl Called Echo*. The novel follows 13-year-old Echo Desjardins as she struggles with loneliness both at home and at school. As she learns about Métis communities in a history class, she begins to day-dream—time-slipping in and out of the Saskatchewan prairie during the era of fur trade wars in the early 1800s. Our students appreciate the easy interplay of word and text and how themes of dislocation, identity, liminality, and (re)connections to place and heritage are visually invoked.

We choose Vermette's contemporary text to highlight the central tenet of postcolonial theory—that the practices and effects of colonialism are not over, but ongoing, and perpetuated both systemically and through everyday acts and cultural materials (e.g., literary texts). Although the “post” in postcolonialism has been critiqued for seeming to imply otherwise (e.g., Churchill, 2012), it is perhaps helpful to characterize postcolonial readings—and postcolonial texts themselves—as part of an active process to dismantle colonialist ideologies and universalist accounts of the human experience (Ashcroft et al., 1995). As McGillis (2000) notes, “Postcolonialism is a decolonizing activity, rather than a *fait accompli*” (p. 223).

The aims of postcolonial approaches to literary analysis include interrogating the discursive strategies of colonizing societies and reclaiming the history, cultural contributions, and global significance of those individuals and communities who have been erased, silenced, or dismissed (Appleman, 2015). As theorized by Said (1979, 1993), Hulme (1986), Spivak (1988, 1990) and Bhabha (1994), colonialist discourses promulgated in literary texts mobilize certain representations of land and Other in order to naturalize white colonial sovereignty.

Many have explored how Western texts for young people have served and continue to uphold these colonialist regimes and worldviews (Kutzer, 2000; Reimer, 2008; McGillis, 2000). Early evocations of postcoloniality and CL by Rose (1984) and Nodelman (1992) notably compared children to silenced and exploited subjects in relation to the “colonizing” mythologies and interests of adults. Rebutting this view, postcolonial scholar Bradford (2011a) maintains that conflating children with colonized people not only privileges White, middle-class consumers of children's texts, but also deflects attention away from the realities and lasting effects of colonization. In her own extensive analyses, Bradford (2001, 2007) situates postcolonial discussions of CL within white settler literary traditions (e.g., those stemming from the US, Canada, Australia, and South Africa), analyzing novels by non-Indigenous White authors, such as Speare's (1983) *Sign of the Beaver*, to chronicle how colonial meanings permeate even ostensibly anti-colonial texts (Bradford, 2001).

Other postcolonial readings have considered the long-established links between children's literature and nationalist agendas, noting how depictions of “home” frequently uphold paradigms of citizenship bound by markers of race, class, and gender (e.g., Kelen and Sundmark, 2013; Reimer, 2008). Such discussions have extended to explorations of transnationalism, cosmopolitanism, and multiculturalism in children's texts and literacy practices (McCulloch, 2016a; Wu et al., 2013). While some have questioned the literary romanticization of multilingual, hypermobile child elites in an age of globalization (Bradford, 2011b; Snell, 2014), others have drawn on postcolonial theory to examine themes of hybridity and transculturation as characters negotiate national, linguistic, and cultural borders (Brochin and Medina, 2017; Christensen, 2013; González, 2018).

Postcolonial theory has also informed anticolonial and decolonizing strategies in schools and literature classrooms. As Sung et al. (2017) argue, despite the large body of US immigrant-themed narratives published between 2000 and 2006, contemporary novels are still “replete with postcolonial narratives that foster mental images of dominance over immigrant, migrant, and refugee people” (p. 45). Drawing on Ladson-Billing's (1998) call for critical race studies in education, Sinclair (2018) illustrates how the careful selection of texts, such as Older's (2015) YA novel, *Shadowshaper*, might begin to decolonize English literature classrooms where Eurocentric Whiteness is the norm. As Bradford (2021) notes, “postcolonialism now aligns itself with critical race theory and whiteness studies, thus enabling comparative and historicized approaches that consider both national literatures and the global conditions in which they are produced” (p. 153).

Activist lenses: critical race, critical disabilities, and ecocriticism

Reflecting the growth of scholarship and the widespread recognition of CL and YAL across academic fields, a number of critical readings are structured around overtly activist objectives. Many examples, such as those featured at the 2013 *Journal of Language and Literacy Education* inaugural Activist Literacies conference, wed children's literature scholarship with educational aims—considering how a range of youth media “is both a tool of and for activism” (Graff, 2013). As Bradford (2017) maintains, critical reading does not “comprise a body of rules or strategies, but is always situated and contingent, calling on us to be alive to how texts for children position their readers, the ideologies they advocate, and the worlds they imagine” (p. 26). Below are three examples of how activist

readings have emerged through applications of critical race theory, critical disabilities studies, and ecocritical frameworks to texts for young people.

Critical race theory

Since its inception in the 1970s, critical race theory (CRT) has become a core discipline in US law schools, used to interrogate how legal structures and legislation contribute to the systemic oppression of Black and Indigenous peoples, people of color, and immigrants to the United States (e.g., Mills & Unsworth, 2018; Crenshaw, 1995; Crenshaw et al., 2019). From a legal and political activist standpoint, the central objective of a CRT lens is to understand the embedded nature of racism in order to address it through structural change, legal reform, and other democratic interventions. As Delgado and Stefancic (2017) note, “unlike traditional civil rights discourse, which stresses incrementalism and step-by-step progress, critical race theory questions the very foundation of the liberal order” (p. 3).

Building on this legal foundation, Ladson-Billings and Tate (1995) reshaped CRT as a tool for confronting the ongoing oppression and marginalization of groups within and across educational systems and institutions (see also: Ladson-Billings, 1998; Tate, 1997). According to Solórzano (1998), a CRT lens in education foregrounds five defining elements: “(1) The centrality and intersectionality of race and racism; (2) the challenge to dominant ideology (3) the commitment to social justice; (4) the emphasis of experiential knowledge; and (5) the importance of interdisciplinary perspectives” (Osorio, 2018, p. 94). As it has advanced and undergone critiques in education and humanities scholarship, CRT has sparked a number of other racialized “Crits”—such as Black-Crit, LatCrit, AsianCrit, and TribalCrit—that seek to more precisely address and complicate how racism affects and is experienced by intersectional group identities (e.g., Brayboy, 2005; Chae, 2004; Dumas and Ross, 2016; Osorio, 2018; Solórzano and Yosso, 2002; Writer, 2008).

The tenets of CRT in the context of children's literature scholarship remain equally wedded to these social justice objectives, often advocating a critical renegotiation of texts in the interest of what Thomas and Stornaiuolo (2016) term “textual justice.” Many of these explorations seek to detail how specific racialized groups have shaped or have been represented in literature for children and youth (Acevedo, 2015; Bishop, 2007; García, 2021; Reese, 2008)—while at the same time lamenting the dearth of children's publications written by, and for, Indigenous people and people of color. As CL author Myers (2014) opined: “Books transmit values. They explore our common humanity. What is the message when some children are not represented in those books?” (para. 18).

CRT and other “racecrit”-based readings of children's literature, including whiteness studies (e.g., Engles and Kory, 2014b; Sams and Boyd, 2019), examine racist or “colorblind” ideologies and discourses in texts and media (e.g., Cappiccie et al., 2012; Ishizuka and Stephens, 2019); counter-storytelling techniques that reclaim experiences of oppressed groups (e.g., Brooks, 2009; Tulino et al., 2019); and the fusion of CRT-based literary scholarship with transformative, antiracist teaching practices and policies (e.g., Johnson, 2018; Lesley, 2017). For instance, Cueto and Brooks (2019) illuminate the counter-storytelling strategies employed in visual texts—arguing that picturebooks like *I am Enough* (Byers and Bobo, 2018) and *Uptown* (Collier, 2000) dismantle the hegemonic White gaze and “embody the potential to initiate, support, and promote change” (p. 41). Addressing ways graphic life writing might be used as a tool for literature educators, Marshall (2016) similarly notes how certain texts can serve as powerful media for representing diverse realities and demonstrating antiracist curricula, pedagogy, and everyday practices.

Turning attention to the inherent racism of narrative structures, Thomas (2019) pairs CRT with Afrofuturism to reconsider the disparaging metaphorical use of Blackness in contemporary speculative and high fantasy texts. In her discussion of the character Rue from *The Hunger Games* (Collins, 2008), she notes the overwhelmingly negative reaction by some readers and viewers when Amandla Stenberg was cast in the film adaptation. As Thomas argues, the revelation of Rue's Blackness was viewed as transgressive, even unwelcome, precisely because cultural scripts of Whiteness, Blackness, and fantasy genres rely upon a Black/White, Villain/Hero dichotomy. The hostile rejection of Rue by some fans underscores the endemic nature of what Thomas terms “the dark fantastic”—the cyclic rejection of racially-marked characters in service of the presumed White qualities of “goodness, beauty, innocence, and truth.”

Critical disabilities studies

At the heart of disability studies—an interdisciplinary field of academic scholarship and activism—lies the tension between medical and social models of disability (Davis, 1995, 2013). Whereas medical definitions tend to pathologize disability as a personal affliction, the social models that arose during the Civil Rights campaigns of the 1960s differentiated cognitive or physical impairments from the disabling practices imposed by society (Hunt, 1966; Shakespeare, 2013). More recent debates have spawned “interactionist” perspectives, drawing from Butler (1993) and Foucault and Sheridan-Smith (1979) to further define disability as the ongoing production of material bodies as they interact with the institutions, policies, and norms of social environments (Baglieri and Lalvani, 2020; Hall, 2016). As with social models, interactionist views recognize the embodied experiences of individuals while also espousing notions of disability as a political identity for social change.

In keeping with social and interactionist models, applications of critical disability studies frameworks in literature scholarship question normative constructions of bodies and minds (i.e., “ableist” discourses and assumptions; see Garland-Thomson, 1997; Campbell, 2009). Literature scholars often cite the use of disability as a metaphor, or narrative device—marking an individual's deviance against which the “hegemony of normalcy” (Davis, 1995, p. 44) might be narratively constructed and maintained. Terming this phenomenon the “narrative prosthesis,” Mitchell and Snyder (2000) argue that disability is frequently invoked as shorthand

for moral depravity, weakness, or the superhuman capacity for resilience and fortitude (as in the controversial trope of “supercrips;” see Schalk, 2016; Shapiro, 1994). Further, they note, literary canons—featuring work such as Charles Dickens’ *A Christmas Carol* (1843), and John Steinbeck’s *Of Mice and Men* (1937)—shape and normalize dominant narratives of disability more than policies (Snyder and Mitchell, 2007).

The literary tendency to equate disability with deficiency, criminality, or disease has been especially pervasive throughout fictional portraits of childhood. As Hollander (2018) argues, the conflation of disability, morality, and class adopted by eugenicists in the early 20th century led to the construction of dystopic childhood narratives, wherein fictional disabled children embodied fears over the future of nationhood. Ableist portrayals of disabled children being “cured” were also common scripts in 19th and early 20th century novels for children, evident in work such as Johanna Spyri’s *Heidi* (1880/2012), Eleanor Porter’s *Pollyanna* (1913), and Frances Hodgson Burnett’s *The Secret Garden* (1911) (Nikolajeva, 2016). Reductive portraits of disabled childhood have served as symbols of either a crumbling empire or, alternatively, a society on the mend—equating a child’s return to able-bodiedness with a nation’s own potential for an economically productive future.

While analyses of CL and YAL continue to catalog dehumanizing depictions in classic and contemporary work (e.g., Aho and Alter, 2018; Meyer, 2013), critical disabilities scholars also consider the productive and pedagogical possibilities of characterizations of disabilities, even well-worn tropes (e.g., Dunn, 2015; Murray, 2012). Detailing how the “autistic savant” detective in Haddon’s 2003 novel, *The Curious Incident of the Dog in the Night-Time*, is inherently problematic, Resene (2016) observes how that same characterization of a neurodiverse mystery-solver is employed to an empowering effect in Dowd’s (2007) novel, *The London Eye Mystery*. As Resene and others argue, the inclusion of CL and YAL characters with “alternative corporealities” (McRuer, 2006, p. 146) can generate greater empathy and understanding, challenging misconceptions and encouraging readers to share their own experiences (Kersten, 2018).

Wheeler (2019) further argues that protagonists with disabilities produce and reflect profound political and cultural change—redefining whose stories and perspectives are valued in public spaces. Extending this transformative potential to the classroom, Kleekamp and Zapata (2019) note how diverse literary representations of disabilities can provide teachers with tools to create more inclusive learning spaces. To this end, scholars have also fused disability studies lenses with feminist, queer, or critical race approaches, “cripping” explorations of intersectional nonnormative bodies and minds (e.g., Annamma et al., 2018; Kafer, 2013). As Markotić (2018) details in her analyses of Canadian YAL, the social constructions and embodied experiences of gender, queerness, and corporeal difference can be narratively linked in complex, destabilizing ways as adolescent characters negotiate multiple boundaries of identity.

Ecocriticism

Like the other activist lenses under discussion, literary ecocritical frameworks are used to explore themes and patterns of representation as well as to evaluate how texts might guide readers toward activist goals (Buell, 1995, 2005; Garrard, 2012). Inspired by feminist theory and African American studies scholars, Cheryll Glotfelty (e.g., Glotfelty and Fromm, 1996) is routinely credited with shaping the development of “ecocriticism” (a term coined by William Rueckert in 1978) as a literary discipline. As she notes, this interdisciplinary work arose from an interest in how textual analysis of landscape and place might enrich environmental studies and broaden awareness of ecological issues (Glotfelty and Balaev, 2012).

In terms of children’s literature scholarship, ecocritical analyses seek to examine the relationships between young protagonists and their landscapes and environments—at the same time considering the didactic potential of those texts to promote conservationist efforts and ecojustice (e.g., Dobrin and Kidd, 2004; Gaard, 2009). Many scholars cite the ongoing Western association of the Romantic child with the natural world (Reimer, 2013), stemming from 19th century English and Anglo-American novels. According to Darcy (1995), the personal and spiritual growth afforded by rural idylls in works such as Hodgson Burnett’s *The Secret Garden* (1911) and Kenneth Grahame’s *The Wind and the Willows* (1908) underscore the nascent conservationist agendas of literature published in the wake of the Industrial Revolution. These interconnected themes of nostalgia for childhood and the environment reverberate throughout 20th and 21st century children’s texts as well—albeit with more overt appeals for individual or collective action, as exemplified in Seuss’s (1971) *The Lorax* (e.g., Teorey, 2014; Zicht, 1991) and contemporary YA dystopias (Steenkamp, 2015).

Ecocritical scholars are also concerned with how literary conceptions of nature—like childhood—are mutable and inconstant, varying within texts themselves and across genres, eras, and regions and cultures of the world. As Dobrin and Kidd (2004) note, “the ‘wild’ is hardly a neutral concept but an ever shifting rhetorical and political term in need of specific elaborations. Neither are terms like nature or the environment free-floating or self-evident” (p. 2). Focusing mainly on Nordic literatures, the editors and contributors of the 2018 volume *Ecocritical Perspectives on Children’s Texts and Cultures* unpack nature as an umbrella term for a range of esthetics and topics, including landscapes, vegetation, animals, and humans (Goga et al., 2018). In his chronicle of the literary child-nature connection, Hollindale (2021) likewise details how constructions of nature in Anglophone literature have undergone various shifts in tone and intent—from pastoral idylls in *Robinson Crusoe* (Defoe, 1719) to survival stories of savagery or vulnerability in *Lord of the Flies* (Golding, 1954) and *Eva* (Dickinson, 1988).

In recent years, ecocriticism in children’s literature scholarship has broadened alongside other critical cultural lenses (e.g., Duckworth and Guanio-Uluru, 2022). Scholars have combined ecocritical readings with feminist, postcolonial, and posthumanist frameworks examine how texts perpetuate or resist traditionally gendered, imperialist, and anthropocentric perspectives of the natural world. While some have detailed how wilderness coincides with constructions of masculinities and femininities (e.g., Kidd,

2004; Newtown, 2010; Stephens, 2002), others have adopted ecofeminist readings (Gaard et al., 2013) to note how vulnerable bodies of women and youth function as symbols of at-risk ecologies (Curry, 2013; Elbert, 2014).

Ultimately, ecocritical frameworks seek to highlight texts, worldviews, and approaches to reading that inspire social change—and develop youth as local and global ecocitizens (see also: Echterling, 2016a,b; Massey and Bradford, 2011; Moriarty, 2021). For instance, Soulioti (2021) discusses how ecocentric plots and visuals in Greek picturebooks address the real-world destruction of Mediterranean forest ecosystems while still conveying “positive messages on what can plausibly be achieved” (para. 4). Turning to Appalachia and *The Hunger Games* (Collins, 2008), Harde (2018) similarly argues that the continued destruction and rejuvenation of Katniss’s body interrelate with the environmental exploitation of District 12, offering “an eco-political conclusion that might suggest to young readers their own physical and political engagements with their homelands” (p. 69). As climate justice campaigns intensify and U.N. accounts of climate change grow increasingly dire, ecocriticism continues to grapple with literature’s educational and political role in environmental awareness and activism.

Conclusion

Our selective journey through the array of critical frameworks that can be brought to bear in reading CL and YAL necessarily excludes many perspectives that have been productively mobilized to interpret literature for young readers. For instance, scholars have examined children’s and YA literature through Lacanian psychoanalytic lenses (e.g., Coats, 2004; Wilkie-Stibbs, 2002) to explore how the figurative child relates to fractured instantiations of the self in the modern era. An emerging area of critical scholarship, spatiality, draws on the geographical concepts and frameworks of Massey (1994, 2005), Tuan (1977), and others to interrogate the contingency of youth participation and belonging in certain spaces and places—underscoring themes of exclusion and displacement as well as the ways fictional youth negotiate the cultural and physical borders of their worlds (e.g., Glenn, 2019; Hamilton-McKenna and Rogers, 2021; Murray and Cortés-Morales, 2019). And, broadening the notion of textual spaces, scholars interested in transmedia (Jenkins, 2006; Kress, 2010), or cross-media narratives, investigate how the ever-changing, interactive reader engagement with story—as well as the story itself—travel and blur in potentially creative ways across fluid media adaptations and modalities (e.g., Bullen et al., 2018; Hamer, 2017). Many of the students we work with choose to draw on these lenses as well to think about their own scholarship and teaching.

For the final project in our course, we ask students to present analyses of literary works or to develop or adapt literature units for classrooms—encouraging them to draw on the myriad critical perspectives or even weave together frameworks that best fit their chosen texts. One student, a middle grade English teacher, designed a unit on selected speculative “cli-fi” texts for young people, illustrating how reading environmental literature through ecofeminist and postcolonial perspectives might empower students to take productive action toward creating more sustainable, equitable communities. Another teacher of English language learners drew on critical race theory and Thomas’ (2019) treatise, *The Dark Fantastic*, to explore the misrepresentation, silencing, or complete absence of East Asian peoples and cultures in YAL and popular texts. As evidence of the normalized dearth of Asian representation in Anglophone fantasy, he shared his surprise upon discovering a prominent character with East Asian heritage in the *Harry Potter* series (Rowling, 1997). An English teacher revised a grade 12 literature unit in which he taught Cheyenne and Arapaho author Orange’s (2018) novel, *There*. This teacher had noticed the reliance on stereotypes among the students when interpreting the novel, so he proposed incorporating postcolonial and critical race theory perspectives to draw attention to the ways Orange actually subverts stereotypes through counternarratives.

What we find most encouraging are the ways in which these early scholars and teachers readily take up the potential of critical perspectives to deepen the conversations about children’s and young adult literature in their work and classrooms. The critical approaches to literature provide educators with a rich set of tools to more fully engage young people in drawing insightful connections across narratives, their own lives, and their cultural and societal contexts. As we have discussed, critical and activist lenses can also contribute to the ongoing project of facilitating students’ thoughtful considerations of the future—offering up literary and interpretive spaces as sites of creative reimaginings, civic engagement, and social justice.

Introduction

The effects of the postmodern and digital *turns* in children's literature have supported the publication and distribution of picturebooks and novels that contain multimodal designs, metafictional devices, digitally mediated interfaces, varying levels of interactivity, unique paratextual materials, diverse narrative structures, metaleptic transgressions, and transmedial components (Aarseth, 1997; Sargeant, 2015; Sipe and Pantaleo, 2008). Throughout this chapter, we use the term *metafictional* to refer to picturebooks that exhibit metafictional features or elements, and the term *digitally mediated narratives* as an umbrella term to refer to a wide range of textual structures, genres, and formats, including novels and picturebooks across digital devices and platforms. Due to the length limitations of this publication, we focus on narrative examples, only briefly referring to informational texts when appropriate (Fig. 1).

Postmodern and digital turns in children's literature

Throughout history, social, technological, and cultural changes have impacted the ecology of the picturebook and other formats of children's literature (Lewis, 2001; Wolf et al., 2011). The broader historical, social, and cultural movement referred to as postmodernism has also been used to explicate changes in children's literature. Although confusion, vagueness and lack of consensus surrounds the meaning and scope of the term *postmodernism* (Coles and Hall, 2001; Hutcheon, 1980; Sim, 2011; Sipe and Pantaleo, 2008), scholars have developed lists of features or concepts associated with postmodernism (Hassan, 1997; Lewis, 2001) and then applied these characteristics to various disciplines and cultural activities. In children's literature scholarship, features of postmodernism have been used by researchers to analyze and discuss picturebooks and young-adult novels, as well as to explore students' responses and interpretations of such literature (e.g., Allan, 2018; Groenke and Youngquist, 2011; Pantaleo, 2008a,b; Serafini, 2005; Sipe and Pantaleo, 2008).

Dresang (1999) proposed her *Radical Change Theory* to explain how the fundamental changes she observed taking place in children's and young-adult literature were reflective of the "connectivity, interactivity and access in the digital world" (p. 14). Indeed, advances in book design software, printing technologies, and digital interfaces have significantly impacted the evolution of formats, designs, and structures of digital and print-based children's literature in general, and picturebooks specifically.

With the advent of computer technologies, it was only a matter of time before digital platforms, the world wide web, software applications, and electronic devices affected the features, formatting, designs, and types of interactivity associated with the publication of picturebooks and other narratives on digital platforms (Serafini et al., 2015; Yokota and Teale, 2014). Over the past two decades, interactive storybooks on CD-ROM have given way to picturebook apps and subscription-based platforms, offering picturebooks and multimodal novels that can be purchased on software developer websites or in an "app store." The expansion of these digitally mediated narratives was accelerated in 2010 with the introduction of the iPad by Apple Computers and the subsequent development of software specifically designed to offer a range of narratives and informational texts to a younger audience. Across these digital platforms and devices, children's literature became readily available as electronic or *e-books* and as self-contained software applications or *picturebook apps*.

The introduction of digital tablets required readers to navigate narrative texts in different ways when compared with the requirements of reading print-based picturebooks in codex formats. Electronic devices, touch screens, and digital software designs continue

- a) “overly obtrusive narrators who directly address readers and comment on their own narrations” (McCallum, 1996, p. 397) (Anstey, 2002; Athanasiou-Krikelis, 2018; Georgakopoulou, 1991; Lodge, 1992; Nikolajeva & Scott, 2001; Silva-Díaz, 2018; Stephens & Watson, 1994; Waugh, 1984)
- b) multiple narrators or character focalisers (McCallum, 1996; Silva-Díaz, 2018; Stephens & Watson, 1994; Viswanath, 2018;)
- c) manifold or multiple narratives (Goldstone, 1998; McCallum, 1996; Silva-Díaz, 2018; Stephens & Watson, 1994; Trites, 1994; Viswanath, 2018; Waugh, 1984) or multistranded narratives (i.e. “two or more interconnected narrative strands differentiated by shifts in temporal and spatial relationships, and/or shifts in narrative point of view” McCallum, 1996, p. 406)
- d) narrative framing devices (e.g., stories within stories, “Chinese-box structures,” and “characters reading about their own fictional lives ... self-consuming worlds or mutually contradictory situations ... a nesting of narrators” Waugh, 1984, p. 22 & 30; Athanasiou-Krikelis, 2018; Viswanath, 2018)
- e) disruptions of traditional time and space relationships in the narrative(s) (Georgakopoulou, 1991; Goldstone, 1998; Lodge, 1992; McCallum, 1996; Silva-Díaz, 2018; Stephens & Watson, 1994; Viswanath, 2018; Waugh, 1984)
- f) metalepsis – “situations where characters and narrators change places, or shift from one plane of being to another” (Stephens & Watson, 1994, p. 44); disruption to diegetic levels of narration (McCallum, 2004; Athanasiou-Krikelis, 2018; Silva-Díaz, 2018; Viswanath, 2018)
- g) nonlinear and nonsequential plots including narrative discontinuities (Goldstone, 1998; McCallum, 1996; Stephens & Watson, 1994; Viswanath, 2018; Waugh, 1984)
- h) intertextuality (Anstey, 2002; Athanasiou-Krikelis, 2018; McCallum, 1996; Nikolajeva & Scott, 2001; Silva-Díaz, 2018; Waugh, 1984)
- i) “parodic appropriations of other texts, genres and discourses” (Stephens & Watson, 1994, p. 44) (Athanasiou-Krikelis, 2018; McCallum, 1996; Silva-Díaz, 2018; Waugh, 1984)
- j) typographic experimentation (Athanasiou-Krikelis, 2018; McCallum, 1996; Stephens & Watson, 1994; Waugh, 1984)
- k) “mixing of genres, discourse styles, modes of narration and speech representation” (McCallum, 1996, p. 397), including “people prose” (Goldstone, 1998; Stephens & Watson, 1994; Silva-Díaz, 2018; Waugh, 1984)
- l) “a pastiche of illustrative styles” (Anstey, 2002, p. 447; Silva-Díaz, 2018) or literary pastiche (Viswanath, 2018; Waugh, 1984)
- m) “new and unusual design and layout, which challenge the reader’s perception of how to read a book” (Anstey, 2002, p. 447)

Fig. 1 List of metafictional devices. Modified version of list of metafictional devices originally published as “Appendix A: List of Metafictional Devices,” in *Exploring Student Response to Contemporary Picturebooks* by Sylvia Pantaleo © University of Toronto Press 2008 (pp. 191–192). Reprinted with permission of the publisher.

- n) excess (i.e. “testing limits – linguistic, literary, social, conceptual, ethical, narrative” Lewis, 1990, p. 144; Silva-Díaz, 2018)
- o) illustrative framing, including *mise-en-abyme* (i.e. “a text – visual or verbal – embedded within another text as its miniature replica” Nikolajeva & Scott, 2001, p. 226; Athanasiou-Krikelis, 2018)
- p) description of the creative process making readers “conscious of the literary and artistic devices used in the story’s creation” (Goldstone, 1998, p. 50) (Georgakopoulou, 1991; McCallum, 1996; Waugh, 1984)
- q) “indeterminacy in written or illustrative text, plot, character or setting” (Anstey, 2002, p. 447) (Athanasiou-Krikelis, 2018; Goldstone, 1998; Lewis, 1990; McCallum, 1996; Silva-Díaz, 2018)
- r) “availability of multiple readings and meanings for a variety of audiences” (Anstey, 2002, p. 447) (McCallum, 1996; Nikolajeva & Scott, 2001; Stephens & Watson, 1994)

Fig. 1 (continued).

to mediate the interactions between readers and texts and offer narratives for children in new and unique configurations (Sargeant, 2015). The digital book market, including picturebook apps, dwells somewhere between the children’s book market and the general entertainment industry, forcing researchers to recontextualize digitally mediated texts across numerous fields of inquiry and academic domains (Turrión, 2014).

Rather than focusing on heuristic labels such as the postmodern or digital turn to document cultural changes and continuities in children’s literature (Hutcheon, 2002), we begin with a brief explication of the metafictional devices and digitally mediated influences on the world of children’s literature and discuss how these influences have affected the forms, designs, features, and narrative structures of contemporary children’s literature. In addition, we explore a range of *meta-structures* that occur across print-based and digitally mediated texts, focusing specifically on picturebooks, and how these meta-structures work across a range of children’s literature.

Metafictional literature for children

The term *metafiction* was coined by Gass (1970, p. 65), referring to narratives that explicitly break their own mimetic illusion. While Gass alluded specifically to fictional narratives, as is discussed below, metafiction is a transmedial phenomenon evident in paintings, television shows, plays, movies, video games, and apps. Although examples of metafictional texts have existed since the beginning of literary publishing, metafictional writing “began to run rampant in the 1960s” (Hutcheon, 1980, p. 1). Hutcheon (1980) defined metafiction as “fiction about fiction—that is, fiction that includes within itself a commentary on its own narrative and/or linguistic identity” (p. 1). She used the term metafiction to “denote a technically definable literary entity” (Hutcheon, 1980, p. 2), and described narrative texts that exhibit “textual self-awareness” (p. 1) as narcissistic. Waugh (1984), whose scholarship on metafiction is referred to extensively in the literature on this topic, described metafictional writing as writing that “self-consciously and systematically draws attention to its status as an artifact in order to pose questions about the relationship between fiction and reality” (p. 2).

Although metafiction has often been associated with postmodernism, as stated previously, postmodernism is a broader intellectual, historical and cultural phenomenon, and metafiction is “an approach, or set of devices, for undermining expectations or for exposing the fictional nature of fictions” (Lewis, 2001, p. 94). However, as stated by Lewis (2001), “one can see why metafictional devices are essential to the postmodernist enterprise, with its sustained attack on all manifestations of authoritative order and unity” (p. 94). Indeed, many of the features or characteristics of postmodernism and metafiction are similar in nature: “narrative fragmentation and discontinuity, disorder and chaos, code mixing and absurdity” as well as openness, playfulness and parody (McCallum, 1996, p. 400).

Essentially, metafictional texts draw “the attention of readers to how texts work and to how meaning is created through the use of a number of specific devices” (Pantaleo, 2008b, p. 11). In addition, metafictional techniques are generally used in combination and the synergy of numerous devices serves to augment or intensify the fictional status and self-conscious nature of a text. Furthermore, the devices are not mutually exclusive; intersections exist among many of the techniques, and several specific devices can be

incorporated by more general metafictional techniques such as “boundary-breaking” (Lewis, 1990) or “accentuates the reader’s presence and makes the reading process more salient” (Athanasidou-Krikelis, 2018, p. 3).

Many scholars have analyzed and critically examined the nature of metafictional devices in selections of children’s literature. For example, Athanasidou-Krikelis (2018), Viswanath (2018), Schwenke-Wyile (2006) and Pantaleo (2004a,b,c, 2010b) have explored the metafictional nature of a variety of picturebooks published in English. Silva-Díaz (2018) has provided examples of picturebooks written in languages other than English that feature metafictional devices. Examination of picturebooks with metafictional devices reveals a gradation in the number of techniques featured in the books, as well as the contribution of the devices to the overall quality of the book and to the reading transaction. In picturebooks, metafictional devices range from being tangential to integral to the story.

Many novels for children and youth also feature metafictional devices. *Save Me a Seat* (Weeks and Varadarajan, 2016), *Wonder* (Palacio, 2012), and *Hello Universe* (Kelly, 2017), are examples of metafictional novels for elementary and middle school students that feature several character focalizers and narrative strands. In the novel *Operation Frog Effect* (Scheerger, 2019), prose, comics, letters, free verse poetry, play script and journal entry format are some of the discourse styles of representation used by the eight character-focalizers to communicate their point of view. In *Project Mulberry* (Park, 2005), chapters interspersed with dialog between the main character, Julia, and her author provide readers with a perspective on Park’s creative writing process.

According to McCallum (1996), metafictional devices can contribute to readers’ esthetic reading experiences offering “a heightened sense of the status of fiction as an elaborate form of play, that is a game with linguistic and narrative codes and conventions” (p. 398). Indeed, while simultaneously providing the pleasure of non-conformity, metafictional devices can contribute to students’ narrative competence (Prince, 2003) by “laying bare the mechanics” of its fiction-making (Hutcheon, 1980, p. 63). By “involving readers in the production of textual meanings, metafictional devices can implicitly teach literary and cultural codes and conventions, as well as specific interpretive strategies, and hence empower readers to read more competently” (McCallum, 2004, p. 588). Many picturebooks with metafictional devices afford readers opportunities for pleasurable reading transactions as they puzzle through the multiple layers of meaning and ambiguity and engage in interpretive strategies in a playful and game-like manner (Pantaleo, 2004a, 2008b). In addition to facilitating readers’ higher-level thinking skills, picturebooks with metafictional devices can contribute to the development of their visual literacy competence, as well as enhance their literacy and literary understandings, including the growth of a repertoire of narrative structures (Pantaleo, 2004b, 2008a, 2010a; Silva-Díaz, 2018; Viswanath, 2018). Finally, developing metafictional awareness can assist readers as they experience these devices in other print and digital texts both within and out of school.

Digitally mediated literature for children

All forms of *digitally mediated literature* require digital software, an electronic platform and device to be experienced. Whether the narrative presented is a digital translation or adaptation of an analog or print-based picturebook or novel, sometimes referred to as a *digital immigrant* (Schwebs, 2014), or a narrative that was originally created electronically, sometimes referred to as a *digital native* or *native e-lit* (Stichnothe, 2014), a tablet, smartphone, or computer screen mediates the narrative, serving as a digital interface between the story and the reader.

In an early definition of digital literature, Holtzman, in his book *Digital Mosaics* (1997), offered the following characteristics of these textual forms: (1) discontinuity—no pre-determined reading paths, (2) interactivity—demands active participation, (3) dynamism—generates a wide range of production possibilities, (4) ethereal worlds—no material aspects of the work (except devices for accessing it), (5) ephemeral worlds—suggesting the work is manifested only as it is executed, and (6) virtual communities. The stability, accessibility, and continuity of conventional narratives are challenged in digital environments requiring different ways for readers to interact and experience various digitally mediated narratives.

Regardless of the labels used to describe digitally mediated literature for children, including e-books, enhanced e-books, or picturebook apps, digitally mediated narratives incorporate various media that require a range of analytical frameworks for investigating the storytelling mechanisms and structures used in these multimodal entities. Scholars interested in the social, technological, and cultural factors that affect the forms, structures, and components of contemporary narratives for children need to consider a wider array of analytical frameworks to better understand how these diverse texts work and how they are experienced by young readers (Kachorsky et al., 2016).

Calls for developing a common metalanguage to define and describe the various components, affordances, and multimodal aspects of digitally mediated literature for children has been put forward since these texts were first introduced and investigated (Al-Yaqout and Nikolajeva, 2015). Although there remains little agreed upon terminology for these components and affordances, it is important to advocate for the continual refinement of a vocabulary for describing and investigating the continual evolution of digitally mediated narratives for children.

The types of digitally mediated literature for children available today range from basic *digitized* adaptations of print-based texts to more complex hyperlinked, transmedial, and interactive *cybertexts* that require readers to make decisions about the navigation and structure of the story. Along this *digital spectrum* (Mackey, 2015), types of digitally mediated literature for children range across a wide variety of formats, interactional affordances, and digital features and structures (Serafini et al., 2015). Demarcating the similarities and differences among these various types of digitally mediated narratives is important for understanding the mediational devices used by book publishers, experienced by young readers, and investigated by children’s literature scholars.

Mackey (2011) highlighted several concepts that have emerged in the development of digitally mediated narratives. These concepts suggest a lack of permanence, a blurring of traditional textual boundaries, and the constantly changing nature of digital

texts, and may be used to better understand the new narrative formats, structures, and spaces that are being developed in digitally mediated literature.

Unlike an e-book, which is basically a digitized version of a print-based picturebook, a picturebook *app* is a type of software application that consists of picturebook content in a digital form that users navigate using a touch-screen interface (Sargeant, 2015). Along with the features associated with basic e-books, such as digitally displayed text and images, navigational buttons, and home screens, picturebook apps offer interactional features that expand the choices, potential reading paths, and experiences of the reader. Many picturebook apps also include voice over narration, background music, video clips, sound effects, animation, and game-like features, thus creating an experience that sometimes resembles playing a digital game rather than reading a narrative. Most of the features are optional and can be engaged or turned off.

The introduction of digital tablets, including Apple's iPad and Amazon's Kindle Fire enabled picturebooks to be made available in full-color and opened up the market for more publishers and designers to offer their print-based texts across electronic formats and platforms. Recent innovations in software design have made most e-books available across a variety of devices and offered on various *app stores* depending on the device purchased, predominantly Android and iOS software platforms.

Several publishing or design companies, including *Nosy Crow*, *Loud Crow*, *Oceanhousemedia*, and *Winged Chariot Press* offered some of the first picturebook apps that went beyond simple scanned or e-book formats, offering enhanced features including voice-overs, interactive features, musical backgrounds, and hyperlinks. In addition, *Nosy Crow* and *Oceanhousemedia* have created proprietary software engines for further development of digitally mediated picturebooks.

In addition to the previously mentioned affordances, there are limitations associated with digitally mediated literature, including the challenge of sharing digital texts with other readers due to software restrictions, a shortened shelf-life caused by frequent updates associated with improvements in particular operating systems, and the initial expense of purchasing, charging, and maintaining an electronic device. Some of the biggest challenges with digitally mediated narratives involve the archiving and retrieval of electronic texts, and the continuing evolution of the software itself. From a publication and archival perspective, when print-based books go out of print, old copies are still available to read or purchase.

When a digital book or picturebook app is updated, or the operating system on the supporting device is updated, no older version remains available to archive or analyze. In fact, many of the original picturebook apps analyzed and mentioned in this chapter have become unavailable due to system upgrades, making one's financial outlays for them irretrievable. Sharing digital e-books and picturebook apps is not as easy as handing a print-based picturebook to a friend or storing one on the library shelf, as many of these apps remain proprietary to the device on which they were purchased.

In the following sections of this chapter, we address a selection of meta-structures that include a variety of metafictional devices rendered in digitally mediated literature for children. Each meta-structure is instantiated in different ways across print-based and digital media and affects the readers' experiences and the structures and features inherent in the narratives themselves.

Multimodality

Picturebooks, textbooks, websites, screen-based apps, digital texts, museum exhibits, television programs, and billboards are just a few examples of the wide variety of multimodal texts young readers experience in contemporary society. Multimodal texts are composed of a variety of *semiotic resources* that are used to represent and communicate meaning across particular social contexts. According to theories of social semiotics, the semiotic resources of a community are defined as socioculturally and historically shaped materials or modes for making meaning (Bezemer and Kress, 2016). All available modes, such as written and oral language, images, gestures, sculpture, architecture, and music include various semiotic resources, organizing principles, limitations and affordances, which affect the possibilities for communication and representation in today's world.

Kress (2015) uses the term multimodal ensemble to refer to "a designed complex of different modes" (p. 57) and emphasizes how "the meaning of the whole arises out of the contribution of each part in its interaction with all other parts" (p. 57). Indeed, although in multimodal ensembles, analysis can focus specifically on the meaning-making affordances of each mode, it is essential to understand and consider how intersemiotic combinations and relationships among modes constitute an integrated whole (Jewitt, 2014; O'Halloran, 2004).

In general, multimodality and social semiotics are concerned with how people generate meanings in transaction with multimodal texts, including written language, visual images, and design features, from a variety of perspectives to meet the requirements of particular social contexts (Serafini, 2014).

The multimodal nature of print-based children's literature extends beyond picturebooks. For example, an examination of a collection of multimodal novels by Reid and Serafini (2018) revealed the variation, and complexity of use and relationship among multiple modes to communicate and represent meaning in these texts. In their qualitative content analysis of the multimodal covers of 21 young-adult titles in both graphic novel and novel format, Kachorsky and Reid (2020) noted how the distinct differences in the images and design elements on the covers communicated both overt and symbolic messages about the intended audience and the role of literary elements of each format of text. Furthermore, they described how publishers established a relationship between the young-adult novel and the graphic novel through the use of "design features and branding devices" on the covers (Kachorsky and Reid, 2020, p. 314).

Whereas, print-based picturebooks draw on visual images, design elements, and written language as modes of meaning making, children's picturebook apps expand the types of modalities presented by including animation, sound effects, music, and embodied

user interactions to orchestrate complex ensembles of meaning in addition to text and image (Serafini et al., 2016). The transition of picturebooks from printed codex into a digitally mediated format is a reflection of the shaping of semiotic resources to accommodate emerging ways of constructing meaning in the digital age.

Digitally mediated texts are created using computer processing codes or binary codes. These codes are the same regardless of whether they are used to represent language, images, videos, gaming modules, or navigational hotspots on an electronic device. It is this common ground in basic digital coding that has allowed publishers and picturebook app designers to easily incorporate multimodal elements into electronic texts and applications. Although images and text and other multimodal elements appear in different forms on the tablet, computer or smartphone, the common building blocks at the level of digitization readily affords designers of picturebook apps the ability to blend a range of modalities in their apps and e-books.

Materiality

The materiality of print-based picturebooks refers to the physical and sensory qualities of materials and design structures used in creating traditional picturebooks. In the opinion of Alaca (2018), the materiality of picturebooks is “a third narrative system, alongside text and images ... that deepens children’s understanding of a story, initiate[s] play, and make[s] connection to the real world” (pp. 66–67). Indeed, the materiality of print-based picturebooks contributes significantly to the reading experience—to readers’ expectations, appreciation, interpretations and evaluation of and responses to books in both print and digital forms.

Nikolajeva (2008) emphasized how substantial changes to the materiality of picturebooks, such as inclusion in “anthologies where covers are absent, [and] several double spreads placed on the same page” (p. 59), can ruin their “esthetic totality” (p. 59). Furthermore, some aspects of the materiality of hardback editions of picturebooks (e.g., stamping) are impossible to reproduce in paperback editions. In addition, some publishers choose not to replicate all of the peritextual features (e.g., endpapers) in the paperback edition. As physical and esthetic entities, these design and publication decisions affect the meaning-making potential of picturebooks.

The affordances and constraints for making meaning are affected by the material boundaries of this format of literature. In fact, playing with the material form of books, including the size and shape, has a long history in literature. However, advances in technology have simultaneously shaped innovations in printing, which have expanded options for the types of materials used in the production and the overall design of picturebooks.

In some of their metafictional picturebooks, creators Emily Gravett and Lauren Childs have incorporated “the materiality of the book into the narrative” (Do Rozario, 2012, p. 151). In addition to drawing attention to the materiality of books themselves, both Gravett and Childs have explored “the kinds of relationships that form between readers and books through the act of reading” in some of their creations (Do Rozario, 2012, p. 153). In the metafictional picturebooks *Wolves* (2005) by Gravett and *Who’s Afraid of the Big Bad Book?* (2002) by Childs, the creators concurrently “make visible the power and constraints of the bound page” and “interrupt and interrogate the static qualities” of print-based texts (Mackey, 2008, p. 115). Gravett’s overall book design and playful use of material aspects in *Wolves*, specifically the peritextual features, draw readers’ attention to the status of the picturebook as an artifact (Hutcheon, 1980) and position readers inside a book system (Mackey, 2008).

Interestingly, Mackey (2008) suggested children’s awareness of the physicality of the book has been heightened because of their experiences with digital texts and formats (p. 103). The materiality of picturebooks, the physicality of these esthetic objects, cannot be replicated with digital books, interfaces, and devices. Furthermore, comparison of the nature and thus the affordances of materiality of print-based picturebooks to the (im)materiality of digital picturebooks or apps by Al-Yaqout and Nikolajeva (2015) revealed fundamental differences that affect the design of the book, “the esthetic experience of the narrative” (p. 3), and the perceptual and sensory reading experience.

The different ways picturebook narratives are mediated across analog and digital platforms and devices should not be conceptualized as a neutral or innocent form of mediation that simply represents the narrative without affecting a reader’s experience. The differences between print-based texts and digitally mediated texts extend beyond material considerations and affect the meanings constructed by readers and the experiences they have with these texts. Whether the tactile, navigational, and experiential demands associated with digitally mediated literature deters or supports children’s engagements compared with print-based counterparts has been investigated using cognitively-based experimental studies designed to identify variables that affect readers’ experiences and levels of comprehension (Kucirkova, 2017).

In contrast, Hateley (2013) suggests the size and shape of digital tablets (iPad and Kindle Fire) does not necessarily differ all that much from the physical experience of reading a print-based or codex picturebook. Drawing on *skeumorphs* (Sargeant, 2015), virtual features that mimic print-based experiences, digitally mediated picturebooks offer visual aids for navigating and progressing through digital texts, including the sounds of pages turning, visual renderings of pages turning, and the opening and closing of virtual book covers. These particular visual features of digitally mediated narratives help readers connect to their previous experiences with print-based texts.

Some features of children’s literature are present in both print-based and digitally mediated instantiations, including pages, page turns, chapters, covers, titles, characters, and settings, while other features are present exclusively in one or the other forms, including book spines, size and dimensional characteristics, and different types of paper used in printed texts, and video clips, sound effects, and gaming modules for digitally mediated texts. Essentially, picturebooks and picturebook apps have unique ways of *being* texts and have created their own specific materiality and forms of mediating interfaces (Henkel, 2018).

Movements of the reader's fingers across the touch-sensitive screen creates an illusion of materiality that differs from the material object of a print-based picturebook. In order to activate components of an interactive or enhanced picturebook, readers are required to swipe, tap, scroll, and press visual triggers or "hotspots" to activate available features and hyperlinks. Whereas, in print-based picturebooks the story progression is controlled by the author, illustrator and designer, with digitally mediated literature the reader has options and can manipulate the story sequence or progression by making gestural moves that changes the structure of the story.

Kurcikova (2019) asserted that digitally mediated literature has both internal and external material properties. External properties include types of haptic engagement, where readers tap, swipe, pinch, stretch, and drag virtual elements across a scratch-resistant glass interface (Wohlwend, 2017). Internal material properties refer to digital story elements, including multimedia and graphic design elements, as well as the digital coding that drives the software application. Additionally, Henkel (2018) described how the materiality of picturebook apps should be analyzed across three dimensions, including the intrinsic, embodied material qualities, the physicality of the app as an embedded device and interface, and the mode of existence or cultural scope of materiality of the app (p. 340).

Augmented reality apps combine the presence of print-based books with the features of digital devices. Drawing on the affordances of a camera lens located on a digital device, augmented reality software is used to locate *visual triggers* that sets in motion additional video and audio components that can be viewed on the digital device. These digitally rendered visual and textual features can be overlaid on the environment in which the reader is located, allowing the reader to blend the virtual world of the text with the world in which they live.

Moonbot Studios, the work of acclaimed children's author and illustrator William Joyce, developed an augmented reality software application, called *Imag-N-O-Tron*, that was designed to work with his print-based picturebooks, including *The Numberlys* (Joyce, 2014) and *The Fantastic Flying Books of Mr. Morris Lessmore* (Joyce, 2012). By holding the digital device above the print-based picturebook, the camera detected unique visual markers in the print book and set in motion additional narrative features that could be viewed and manipulated on the digital device. Unfortunately, at the time of this writing many of the augmented reality and picturebook apps are no longer available due to updated operating systems. In a personal communication, Joyce stated the expense of constantly updating these picturebook apps was prohibitive for his company due to sales of the app being less than originally predicted.

Interactivity

Kucirkova (2017) generated an integrative framework for theorizing and researching interactivity in children's digital books. Based on a content analysis of one hundred children's digitally mediated interactive narrative picturebooks, Kucirkova (2017) identified five categories of interactivity and listed "the design elements that can be incorporated" (p. 1176) into digital books for each category. Only the interactivity category of synesthesia, "a sense experience or sense impression, derived from reading a book" (Kucirkova, 2017, p. 1176), is pertinent to a discussion of print-based books. Visual presentation, touch manipulation, and audio presentation are three key ingredients or elements of synesthesia.

Reading print-based literature involves holding a book, moving the eyes and turning the pages. In pop-up books and some board and trade books, readers can pull flaps, touch some tactile material or manipulate movable parts such as the newspaper in *Fairytale News* (Hawkins and Hawkins, 2004) or the postcards in *Meerkat Mail* (Gravett, 2006). In Pilkey's (2016) graphic novels and his *Captain Underpants* (2010) books, he includes examples of "flip-o-rama", which is a method of animation where pictures appear to move when readers flip the right-hand page back and forth. Other design features in books requiring physical interaction by readers are gatefolds. Some picturebooks have a single gatefold (e.g., *The Getaway*, Vere, 2006) or a double gatefold (e.g., *Window*, Arbona, 2020; *Who's Afraid of the Big Bad Book?*, Child, 2002) that readers must open to follow the progression of the narrative. Finally, the nature of reading aloud of print-based literature is a key factor in the sensory experience of the reading event. Typographical features of the written text provide readers with information about how to interpret the visual voice of typefaces. In addition, when reading silently one's inner voice can be considered as an aspect of audio presentation.

Many of the metafictional devices included in contemporary picturebooks, "demand a greater degree of attentiveness and interaction ... [as readers] must decide whether to 'point and click' here or there with their eyes and their minds" (Dresang, 1999, p. 114). One example of an interactive format is the inclusion of manifold or multiple narratives. A second narrative may be told entirely through illustrations (e.g., *Something From Nothing*, Gilman, 1992); or parallel stories may be told with images and written language (e.g., *Artie and Julie*, Chih-Yuan, 2008). Readers must assume more active interpretive roles as they make connections between the multiple narratives.

Other metafictional devices that create an interactive format include authors commenting on the story or directly addressing characters (e.g., *Snappy the Alligator (Did Not Ask to Be in this Book!)*, Falatko and Miller, 2016); or obtrusive characters directly addressing readers and/or the author (e.g., *An Undone Fairy Tale*, Lendler and Martin, 2005); or a character, who is also the narrator, addressing readers (*This Book Will Not be Fun.*, Dunlap and Tallec, 2017). Reader interactivity is also heightened by the metafictional devices of nonlinear and nonsequential plots including narrative discontinuities (e.g., *Interrupting Chicken*, Stein, 2010); disruptions to the time and space of a diegetic (e.g., *Ivan the Terrier*, Catalanotto, 2007); texts requiring the reading of more than one set of words (e.g., speech bubbles and narrative prose) (e.g., *Knuckle Heads*, Holub and Slack, 2008); and indeterminacy (e.g., *The Three Pigs*, Wiesner, 2001).

With respect to digitally mediated literature, the term interactivity has been used to suggest digital formats and interfaces offer more interactive features or potential within specific tableaux (similar to the page spread in print-based picturebooks), across transitional features including embedded hotspots and skeumorphs, or within enhanced features like hyperlinks, gaming components, on-demand dictionaries and embedded video clips. From these perspectives, interactivity has been defined as the potential for readers to participate in modifying the form or content of a mediated environment (Serafini et al., 2015), as the characteristics of a particular medium or platform (Schwebs, 2014), as a non-trivial effort on behalf of the reader (Aarseth, 1997), and as the difference among conventional, active, and interactive participation (Turrión, 2014).

Although interactivity remains an elusive concept (Bucy, 2004), various typologies of interactivity have been proposed to elucidate the differences among actual and perceived interactivity (Voorveld et al., 2011), potential, enacted, and required interactivity (Serafini et al., 2015), and passive, active, control-based, and joining forms of interaction (Adami, 2014). In addition, Unsworth (2006) has suggested a continuum of digitally mediated literature that ranges from basic e-books and linear forms of digital texts, through interactive and hyperlinked texts, to more interactive transmedial narratives. Turrión (2014) has suggested the digital, multimodal, non-linear, and transmedial properties of digitally mediated literature can be conceptualized as a rupture of discursive or narrative linearity that is more commonplace among digital texts than print-based counterparts. A basic distinction to be made here is the difference between apps that require readers to do or add something to the story for the story to progress and those where the reader is simply tapping a hotspot on the touchscreen to allow the narrative to unfold in a predetermined sequence. Those apps that require basic reader interactions are closely related to the “choose your own adventure stories” where readers select from a finite number of options as the story unfolds.

In one of the most elaborate analyses and conceptualizations of interactivity, Ryan (2004) constructed a typology of interactive features that fall along two primary axes: (1) external vs. internal interactions, and (2) exploratory versus ontological interactions. External interactions feature a traditional reader experiencing a narrative from a distance whereas internal interactions involve readers interacting as characters, or avatars, “inside” a particular story. Exploratory interactions are involved with looking at, but not changing the nature of the narrative, whereas ontological interactions require decisions or actions that cause changes to the narrative itself (Ryan, 2004).

The multi-touch screen that is featured across digital tablets is a medium-specific affordance that allows or drives readers' engagement with the features of a digital text. According to Rafaeli (1988), the feeling of meaningful dialog between reader and device offered by a touch screen offers a responsiveness and level of control that provides agency for the reader through their interactions with digitally mediated literature. Whereas Lindhe (2010) refers to these interactions or modes of engagement as an *aesthetic of tactility* that embodies experience with digital devices, Soyland and Gulliksen (2019) describe the touch screen of a digital tablet as a form of *virtual materiality* where the virtual elements of a story can be manipulated but not actually touched.

Kurcikova (2019) has advocated for moving past previous conceptions that see interactivity in terms of binary distinctions between reader and text and suggests using “third space” theories to reconceptualize interactivity as a more inclusive, comprehensive aspect of the transaction among readers, texts, and interactions. In either case, the question of whether interactivity is an aspect or feature of the text itself or of the transactions between readers and texts remains a tension in the scholarship on interactivity.

Paratextual features

The concept of paratext was originated by Gérard Genette (1997). He described the paratext as a threshold, an “undefined zone between the inside and the outside, a zone without any hard and fast boundary on either the inward side (turned toward the text) or the outward side (turned toward the world's discourse about the text)” (Genette, 1997, p. 2). Genette (1997) noted how the time “period, culture, genre, author, work, and edition” (p. 3) affected the nature of paratexts.

According to Genette, the overarching category of the paratext is constituted by *epitexts* and *peritexts*. Epitexts, which can be either *private* or *public*, are located outside a book: “any paratextual element not materially appended to the text within the same volume but circulating, as it were, freely, in a virtually limitless physical and social space” (Genette, 1997, p. 344). Genette described two categories of private epitexts: the confidential epitext (e.g., private correspondence with another) and the intimate epitext (e.g., diary or journal). Examples of public epitexts include public critiques or statements (written or oral) about the work by the publisher or creator; lectures, interviews or podcasts by the creator; digital texts associated with a book such as previews or a book trailer; print-based or digital reviews of the work by the creator; and public responses to critics by the creator. Other public epitexts include creators' websites and blogs, publishers' websites and social networking sites.

The entire spatial and material zone of the peritext “is the direct and principal (but not exclusive) responsibility of the publisher” (Genette, 1997, p. 16). Indeed, many authors and illustrators of picturebooks design the publisher's peritext to function as narrative text (Do Rozario, 2012). Other terms used to refer to the elements of the publisher's peritext include *front matter* (Doonan, 1993; Sipe, 2008) and *publishing information* (Sipe, 1998). Peritextual elements in picturebooks include the dust jacket, case (front and back hard covers), endpapers, frontispiece, full title page, half-title page, dedication page, address of publisher, copyright date, price, typesetting style, choice of paper, table of contents, prefaces, intertitles, and footnotes. The inclusion, location and intention of specific peritextual elements varies across picturebooks.

Emily Gravett's intentional design of the peritextual features of *Wolves* (2005) communicates the metafictional nature of the picturebook. Indeed, the synergy of several peritextual elements, including the double binding effect, create additional “versions” of the picturebook. However, the “various versions are never fully separate from each other, coexisting as the one material narrative”

(Do Rozario, 2012, p. 156). Readers must attend closely to visual and textual details on the dust jacket, case, endpages and front matter as these peritextual features are not only significant parts of the narrative, but also they emphasize the physicality of the book as a book and as work of fiction with multiple narratives.

In *Paratexts: Thresholds of Interpretation*, Genette (1997) noted how his nascent theorizing would provide a “provisional service” to others (p. 15). Indeed, in addition to criticizing Genette’s restricted meaning of the term “text” (print books) and his focus on literary works, scholars have applied the concept of paratext to analyses and discussions of audiovisual forms and digitized media (Birke and Christ, 2013; Kümmerling-Meibauer, 2013; Leavenworth, 2015; McCracken, 2013; Stanitzek, 2005). The discussion of the paratextual landscape by Brookey and Gray (2017) reveals the diverse range of topics that academics have explored using the concept of paratext.

Traditional paratextual features are instantiated in unique ways when considering digitally mediated literature for children. McCracken (2013) asserted paratextual features can no longer be studied as singular fixed objects, like those associated with print-based picturebooks, rather elements associated with digitally mediated texts exist temporally and spatially within a particular reading experience. Drawing upon empirical studies of particular digitally mediated picturebooks in lieu of Genette’s (1980, 1988) original theoretical formulations, McCracken (2013) asserted inward and outward pathways from the central text as better ways of conceiving paratextual features.

McCracken (2013) suggested researchers should reconceptualize paratextual features as *centrifugal and centripetal vectors*, rather than focusing on traditional conceptions of *epitext* and *peritext*. Centrifugal vectors potentially draw readers outside the text proper, including publisher-created materials, blogs, reader commentaries, advertisements, affinity spaces associated with the story, and other intertextual links, while centripetal vectors modify the reader’s experience on inward vectors or the internal elements of the text. The centripetal vectors may include readers’ ability to modify the displayed language of the text, selecting how the book shall be read, and choosing to add voiced narration or background music provided in the picturebook app. These paratextual features are more often found in digitally born apps rather than stories adapted from original print-based versions.

The first peritextual element encountered when reading a digitally mediated book or app is the icon used to identify the text on a tablet interface, often accompanied by an abbreviated title. Various icons feature logos from the text or a publisher’s logo or trademark. These standardized icons are very different from how a reader first encounters a print-based text, as regarding size, shape, and material form. The opening screen of picturebook apps and storybooks often features instructions on how to operate or navigate the app or how to proceed through the text, including “read by myself, read to me, or read automatically” options. In order to see the front cover on a digital book, the reader may have to “swipe back” since the default start page is often not the cover.

The peritextual literacy framework (PLF) created by Witte et al. (2019) can be used to identify, comprehend and evaluate peritextual elements in print-based texts and multimodal digital texts across a range of media types and fields. The heuristic focuses on Genette’s (1997) interest in the functional characteristics of paratextual elements: “the functions that the message aims to fulfill (*to do what?*)” (p. 4). The PLF features six types of functions: production, promotional, navigational, intratextual, supplemental and documentary (Gross and Latham, 2017). Although the PLF provides educators with a scaffold “to promote critical thinking in the use, analysis, and production of works” (Gross, 2019, p. 11), fundamentally the PFL draws attention to the importance and multifaceted nature of peritextual information.

Narrative structures and metalepsis

Through multiple experiences with oral and written stories, individuals construct schemata or cognitive representations of story structures, elements and genres. In Genette’s (1980) “systematic theory of narrative” (p. 7), he used the word *story* to signify narrative content; the term *narrative* to denote the “narrative text itself” (p. 27), the oral or written discourse; and the word *narrating* to describe “the producing narrative action and, by extension, the whole of the real or fictional situation in which the action takes place” (p. 27). These terms serve to differentiate between story and plot and convey how various discourses can be used in the telling of a narrative. The terms *fabula* and *sjuzet*, originating in Russian Formalism (Buchanan, 2018; Herman, 2005; Prince, 2003), can also be used to consider how texts are structured and how they achieve their effects (Pantaleo, 2004a). *Fabula* refers to the story, the sequence of events and situations that constitute the story—the chronological order of narrated actions and circumstances. In contrast, *sjuzet* refers to the order and composition of how the *fabula* or story is constructed and narrated (Buchanan, 2018)—the plot. Genette (1980) also wrote about relations between story time and narrative time (p. 33).

Other terms important to understanding the narrative structure of texts include *diegesis* and *metalepsis*. *Diegesis* is “the narrative world, whether fictional or nonfictional” (Phelan and Rabinowitz, 2005, p. 544), in which “the situations and events narrated occur” (Prince, 2003, p. 20). Genette (1980) wrote about the existence of various diegetic levels in narratives and coined the term *metalepsis* to describe a transgression between the “sacred frontier between two worlds [or narrative levels], the world in which one tells, [and] the world of which one tells” (p. 236). As a narrative structural device, *metalepsis* serves to create ambiguity and to increase the complexity of narrative representations by breaching conventional “relationships and hierarchies between characters, texts, authors, illustrators and readers” (McCallum, 2008, p. 181).

Genette (1988 as cited in Pier, 2011) and other individuals have refined and extended his original ideas about the concept of *metalepsis* (see Hanebeck, 2017 and/or Pier, 2016 for a comprehensive discussion of *metalepsis*). Indeed, scholars have written about the occurrence of *metalepsis* across other literary genres, video games, virtual reality technology (Ryan, 2004), animation (Feyersinger, 2010), film, television, theater, digital fiction (Bell, 2014), comics and graphic novels, and art (Kukkonen and Klimek,

2011). As well, taking up a transmedial perspective on the concept reveals how metalepsis is not exclusive to high culture, or innovative written works (Pier, 2011), or postmodern texts.

Scholars have generated taxonomies to distinguish different types of metalepsis (Fludernik, 2003; Hanebeck, 2017; Pier, 2016; Ryan, 2004; Wolf, 2013) (e.g., rhetorical, ontological, and epistemological) (see Pantaleo, 2019 for discussion); created descriptive frameworks to portray the nature of diegetic transgressions (Bell and Alber, 2012; Hanebeck, 2017; Kukkonen, 2011; Pier, 2016) (e.g., ascending, descending and horizontal); and discussed multiple possible effects of metalepses (Bell and Alber, 2012; Feyersinger, 2010; Genette, 1988; Kukkonen, 2011). However, Kukkonen (2011) emphasized the need to consider the relationships between the effects of metalepsis and types of media due to the wide-ranging "spectrum of effects and functions" of metalepsis in popular culture (p. 12). In addition, the effects or potential interpretations of metalepses must be contextualized more broadly to include consideration of reader/viewer and text elements and dynamics. As noted by Hanebeck (2017), "metaleptic texts, performances or artifacts (typically) have a metaleptic *potential* that needs to be *realized* by a reader or viewer" (p. 27).

Although picturebooks can be metafictional in nature without featuring metaleptic transgressions, the breaching of ontological narrative boundaries or levels in texts disrupts their fictional illusion, drawing attention to their artifact status (Waugh, 1984). Metaleptic transgressions of the boundaries between the telling and the told in picturebooks can occur independently or concurrently through written language, images or layout. Some researchers have engaged in content analysis of particular picturebooks and described the nature of the breaching of barriers between diegetic levels (e.g., Pantaleo and Sipe, 2012). Analysis of the kinds of metaleptic transgressions in a collection of contemporary picturebooks (Serafini and Reid, 2019) revealed three main categories, each composed of several subcategories: "(1) rhetorical transgressions only, (2) ontological transgressions only, and (3) a blending of rhetorical and ontological transgressions" (p. 267). The findings from such analyses reveal the diversity and complexity of devices that can be used by picturebook creators to contravene narrative levels.

Digitally mediated children's literature may further expand the possibilities of narrative structures by increasing narrative complexity, fragmentation, non-linearity, and the changing nature of reader interactions with digital media. Hutcheon (2013) proposed three modes of engagement with digitally mediated narratives, namely *telling*, *showing*, and *interacting*, with the last mode of *interactive* being the most salient for this discussion. Digitally mediated children's literature provides a platform for changing the basic nature of how readers interact with narrative structures.

The ontological and rhetorical boundaries found in traditional, print-based literature are dissimilar to those found in digital spaces that easily construct intertextual connections across storyworlds, software that allows readers to record themselves and add to the story through the inclusion of video or audio clips, characters that talk directly to the reader when prompted or touched, and cyber textual features that require readers to play a non-trivial role in the story's development (Aarseth, 1997). These affordances of digitally mediated literature for children provide opportunities for both ontological transgressions of the narrative structure, when the boundaries between reader and text are transgressed by characters addressing the reader directly, narrators breaking the fourth wall, and readers reproducing themselves as avatars and immersing themselves in the narrative itself.

Turion (2014) distinguished between *real* and *simulative* types of participation with digitally mediated narratives. Real participation requires what Aarseth (1997) called *non-trivial interaction*, in other words the reader has to interact with elements and features of the electronic narrative in ways beyond simply turning the page for the story to unfold. In *The Monster at the End of the Book* (Stone, 2003), an early revised version of a well-known print-based picturebook, Grover, the main character in the story directly addresses the reader and instructs them not to turn the page. In this ontological transgression, the reader is made conscious of the materiality and fictionality of the narrative world in the digital narrative. The app version of the story maintains the metafictional play, making the users' interactions more realistic, blurring the boundaries between the narrative and real worlds.

In the augmented reality version of *The Flying Books of Mr. Morris Lessmore* (Joyce, 2012), the reader uses an electronic tablet to bring selected pages of the narrative to life, crossing the boundaries of fictional storyworlds and the world of the reader. These types of ontological transgressions, specifically ascending metalepses where characters leave the storyworld and "enter" the reality of the reader, are directly supported by the affordances of digitally mediated literature in ways print-based texts are not (Serafini and Reid, 2019). Although ontological and rhetorical transgression may occur in both print and digital formats, the affordances provided by digital interfaces and software make these metaleptic boundary crossings easier to produce and design.

In a general sense, all forms of hypertext represent a form of rhetorical transgression as the selected links take the reader from one text to another (Ryan, 2004). These hyperlinked actions may or may not change the diegetic levels of the story and may or may not transgress ontological boundaries as readers connect to different narratives. The path a reader follows when interacting with digitally mediated literature may wander from text to text and across ontological boundaries in similar fashion to animated cartoons, video games, and other cyber texts have done for years.

Transmedial narratives and storytelling

One of the unique features of digitally mediated literature is the potential for transmedial storytelling or narratives that work across a range of texts and media to offer narratives stories across a variety of devices, platforms and modalities. Some forms of digitally mediated literature working across a range of digital platforms to extend the narrative experience are referred to as *transmedial narratives* (Jenkins, 2006). Transmedial narratives are based on the systematic dispersal of integral elements of a storyworld across multiple delivery channels which make a unique, original contribution to a coordinated entertainment experience (Jenkins,

2006). Drawing on a media conscious narratology (Ryan, 2004), transmedial narratives use a range of media, including television, printed text, internet websites, CD-ROM, and audio-visual resources to render a narrative experience.

Transmedial narratives have been researched from a range of theories and academic perspectives including media studies (Ellestrom, 2019), narratology (Thon, 2016), participatory culture (Jenkins, 2013), and affinity groups or spaces (Gee, 2007). Transmedial narratives can be theorized as a digitally mediated form of narrative, as a form of new media (Ryan, 2004), a type of narrative structure and design (Mackey, 2011), a form of adaptation or translation of fictional narratives (Kerchy, 2018), and as a storytelling mechanism (Zheng, 2016). In addition, the evolution of transmedial narratives suggest the need to consider the possible social, cultural, economic, and pedagogical implications for these new texts, platforms, structures, and designs (Ryan, 2004).

Jenkins (2006) asserted transmedial narratives are not always based on individual characters or specific plots but rather complex fictional worlds which can sustain multiple interrelated characters and stories. Some key aspects of transmedial storytelling are the collaborative nature of the work of storytelling, including authors, publishers, and web designers and the relationship between the storytellers and the readers as they navigate the online space that furthers character dynamics, plot, and setting. In many ways, the evolution of digital forms of storytelling and transmedial narratives represent an expansion of the ways we define texts in the digital age and the blurring of boundaries regarding what constitutes a fictional narrative.

One of the first series of transmedial narratives developed for children was the Skeleton Creek stories developed by Cormack (2009, 2016). In this series, readers must purchase a print-based novel and navigate to selected pages in each chapter to get a website address and password to then go online to view video clips offering additional narrative elements from second point of view of the character in the video, then navigate back to the book to continue. Neither the print-based book, nor the video narrated elements offer the complete narrative. A reader must access both narrative representations to experience the story.

It has been suggested that one of the key reasons transmedial narratives have been recently produced in larger numbers, aside from technological advances and possibilities in storytelling, are the economic incentives for large corporations to capitalize on these intersections of well-known characters and storyworlds (Jenkins, 2013; Aarseth, 1997; Ellestrom, 2019; Jenkins, 2013; Kerchy, 2018; Zheng, 2016). By creating different points of entry for consumers, the entertainment industry can take advantage of comic book readers buying movie tickets, and toy manufacturers offering prominent characters from narratives as action figures and so on.

Concluding remarks

The analysis of both metafictional picturebooks and digitally mediated literature requires researchers to consider their manifestation as textual and material objects, their embedment in a particular medium or interface, and the ways various platforms, codices, or digital devices mediate the narrative experience (Henkel, 2018). Working across a range of academic domains, researchers have taken up research on metafictional and digitally mediated literature for children that involves theories associated with narratology, multimodality, gaming, interactivity, and social semiotics. The scholarly literature on metafictional and digitally mediated literature for children continues to expand as researchers draw upon wider ranges of theories and research methods.

Some areas in need for continued investigation include the following: children's responses and opinions about how material affordances of print picturebooks and digitally mediated literature contribute to or affect their reading experiences; the tactile, navigational, and experiential demands associated with digitally mediated literature and consideration of how these demands deter or support children's engagements compared with print-based counterparts; the role of peritextual elements across print and digitally mediated literature; the range of diverse structures included in these complex narratives; and the pedagogical possibilities these texts bring to various educational settings.

The life of Jella Lepman epitomizes the belief that global literature has the potential to open children's minds as a means of transforming society. A German Jew, Lepman fled to London when Hitler came to power, returning almost immediately after the war in response to an invitation to establish cultural programs for children. The decision to return to Germany in 1945 was extremely difficult, given that millions of her people had been killed, but she believed that if children, who only knew their wartime country, were to have a future they needed books to view the world in new ways. Her plea for donations brought in 4000 books from publishers in 14 countries for the first book exhibition, leading to the founding of the International Youth Library (IYL) in Munich. The following year, Lepman founded the International Board on Books for Young People (IBBY), inspired by Eric Kästner's (1949) *Conference of the Animals*, in which animals come together to work toward a common purpose. Seventy years later, the IYL has over 650,000 books and IBBY has 81 countries as members, supporting projects that touch the lives of thousands of children worldwide. The idea that books can build bridges of understanding reaches around the world, built by Lepman's (2002) capacity for forgiveness and compassion and her belief in the transformative potential of global literature.

Lepman's life is a reminder that adults influence what and how children read, particularly in opening children's minds through global literature to provide understandings that go beyond their life experiences. The influence of adults on children's options and positions as readers cuts across all aspects of creating and marketing books and inviting children to connect with these books. In organizing this chapter on the state of the art in global literature, we decided to use the lens of social responsibility to consider children as readers and the adult bookmakers and influencers who surround these books. First, however, the debate about how to define global literature is addressed along with why these books matter in the lives of readers.

The challenge of defining global literature

The inclusion of global children's literature in this encyclopedia assumes that a shared definition exists within the field and across global settings. The reality is that a range of terms are used to label this body of literature, even within the same country, and that global literature is not always viewed as a separate category. Global literature is often not in common usage in countries, such as New Zealand, in which only a small number of books are local with the majority coming from other countries. Their focus is on identifying local books for their children with everything else labeled as children's literature. In contrast, in Western countries like the United States (US), the majority of books are local, in the sense of published within that country by authors from that country about that country, so that only a small number of books are set in other places around the world. In these situations, global literature is an important category to ensure that children have the opportunity to immerse themselves into story worlds set in global cultures. A further complication is that in some countries, such as Germany, differentiating a set of books as global is viewed as unnecessary. So even the recognition of a set of books labeled global literature is not shared globally, let alone a definition.

In this chapter, we define global literature as any book set in a country or global culture outside of the reader's own culture. For a Canadian, any book set outside Canada is considered global, no matter who is the author. A book set in Poland by a Canadian author is global literature as is a fantasy written by a Japanese author in Japanese and then translated into English and/or French for Canadian children. The definition of which books are considered global thus depends on a reader's sense of identity, which is further complicated by children who have more than one cultural identity. Immigrant and refugee children often have multiple

identities, such as both Greek and Syrian, as do “third culture kids” (Pollock and Van Reken, 2001) who spend their childhood moving frequently to new global locations and who often never live in either parent’s country of citizenship.

International literature is one type of global literature, consisting of books originally created and published in a country outside of the reader’s location and then made available in that reader’s country. For a Canadian child, an international book might be published first in Australia in English and then adapted for English publication in Canada, or a book published in Spanish in Chile might be translated into English and/or French in Canada. The important distinction is that these books were first published for children of a country in their own language by an author from that country, before being imported and either translated or adapted for children in a new country.

World literature is a term often used in secondary schools and universities to refer to canonical literature considered exemplary for a geographical region. These books are usually adult classics and are read as high-quality literature representative of those cultures. We are not including world literature since our focus is children’s and young adult literature.

Finally, multicultural literature is sometimes used to refer to global literature. More commonly, multicultural literature indicates the diversity of cultures *within* a country or geographical location, not across global settings. In the US, multicultural literature includes books about groups who are marginalized, stereotyped, or underrepresented by the dominant European-American culture within the US. Multicultural literature thus includes groups marginalized based on race, ethnicity, religion, language, ability, gender identity, sexual orientation, social class, and so on. Since this chapter highlights diversity across global cultures, rather than within a national boundary, multicultural literature is not included.

This chapter thus focuses on global literature, recognizing that this definition includes books and bookmakers from many cultural locations and is based in a definition of the reader’s cultural location. This complexity of defining global literature also acknowledges differing cultural conceptions of global literature’s centrality based on each country’s history of creating literature for children.

The possibilities of global literature in the lives of readers

As long-term advocates of global literature, we are committed to the value of these books in adding possibilities to the lives of readers, both children and the adults who interact with them around these books, including educators, parents, and librarians. We have seen firsthand how global literature can expand readers’ views and encourage open-mindedness toward ways of living and thinking that differ from their own. At the same time, we are painfully aware that asking readers to read outside their comfort zones holds danger and can establish misunderstandings and perpetuate stereotypes.

The possibilities of global literature are grounded in theories of story as a primary act of mind, as the way in which we bring meaning to our experiences and make sense out of the chaos of our daily lives (Rosen, 1986). We create stories in our minds to understand our experiences, so that these stories do not just recount those events but also interpret them. Stories are thus what makes us human—the nature of a life is that it is a story. A web of interconnected stories function in our minds to create our views of the world as we continuously add and rearrange these stories and their connections (Short, 2012).

An understanding of story as world-making underlies the potentials of reading globally, especially in encouraging narrative imagination by inviting readers into story worlds to experience how people, live, feel, and think in global cultures. Through literature, readers immerse themselves into story worlds, providing experiences that go beyond surface-level tourist information to deeper cultural values and beliefs. As readers engage with characters in these story worlds, they develop emotional connections and empathy as well as knowledge about a culture. They learn from, not merely tolerate, those whose views and ways of living differ from their own. They also come to know their own home cultures better through exploring worlds beyond their homes. These understandings grow out of recognizing the common values they share with those living in unfamiliar cultural communities along with the unique differences that distinguish each culture. Experiences with global literature can encourage a stance of openness to how people view themselves, not just how we view them (Short et al., 2016).

Some books feel comfortable to readers even when that book is in an unfamiliar cultural context, and so readers are encouraged to connect with children from those places, providing a sense of community across global borders. Other books stretch readers to go beyond what they know and expand their worldviews to new perspectives, information, and insights that highlight the diversity and richness of the global world (Yokota and Teale, 2017). Still other books, however, are so disconnected from readers’ literary and life experiences that they respond with discomfort and rejection. By surrounding these books with additional experiences and texts, supportive contexts can be created for building understanding, instead of dismissal.

The potentials of global literature thus must be balanced with recognizing the dangers of reading globally and addressing these dangers through our social responsibilities as readers, bookmakers, and influencers (Short, 2019). Social responsibility is a system of ethics from the field of business that argues decisions and actions must be ethically considered along with financial gain, specifically if an action or decision causes harm to people, society or the environment (Chandler, 2016). Rosenblatt (1994) extends this concept, arguing that responsibility as a reader and writer balances individual voice with group responsibility. The right to expression of voice must be weighed against the consequences for others and their right to have their voices heard. Social responsibility thus combines the conviction and enthusiasm of each person’s ideas with an open mind to multiple perspectives and needs in the broader community.

Building on Rosenblatt, theorists use the lens of cosmopolitanism to discuss our responsibility as inhabitants of the cosmos. Hansen (2011) views this orientation as balancing reflective loyalty of the known with reflective openness to the new to create

a philosophy *for* and *of* life rather than about life. Choo (2014) argues literature supports readers in using imagination to critically engage in a stance of hospitable openness to others. Literature functions as a tool for accessing the thinking and beliefs of another person or community, becoming an entry for dialogic inquiry about issues that need to be addressed in order to live fully with diverse peoples in the world. This chapter builds on this idea to explore the responsibilities of bookmakers, readers, educators, researchers, reviewers, and others in relation to global literature.

Before we move into these discussions, we acknowledge our responsibilities as authors of this chapter, recognizing the influence of our backgrounds on our views of the world. Both of us are academics from the field of education in universities in the United States, who also were educators in schools. Our expertise is children's and young adult literature and literacy, with a focus on global and international books and a passion for the ways these books can transform the lives of readers. We are both active in international organizations and award committees, especially IBBY. Kathy has always lived in the US but works with primary teachers around the world to create contexts for dialogue and inquiry around global literature and with researchers on critical content analysis. She is the founding director of a center on global literacies and literatures, Worlds of Words, that offers many resources to educators. Junko was born and raised in Japan, attended one year of high school in the US, and returned for college before becoming an adult immigrant. She is the founding director of the Center for Teaching through Children's Books, which supports teachers and librarians in considering the ways books are central to their teaching. Her research, teaching, and speaking takes her around the world to work with teachers, librarians, and book creators as well as literacy and literature advocates.

Just as we identify our positionality, readers of this chapter are encouraged to examine their perspectives around issues of privilege, specifically the awareness that some are granted unearned privileges that others are denied because of how history and society enact value and oppression due to the cultural group in which people are perceived to belong. Awareness of these societal inequities challenges us to think, read, and face the world to examine how those perspectives influence our decisions in what and how we read, and how we can go beyond talk to take action in addressing these inequities. As authors and readers of this chapter, most of us bring the privilege of advanced education and membership in a community of scholars and so must consider our privilege and resulting responsibilities.

The social responsibility of readers

Although much of the scholarship on global literature focuses on textual authenticity and representations, we believe that global books matter because of their potential for readers. This chapter, thus, first addresses the social responsibilities of readers before considering the responsibilities of bookmakers and adults who influence the field. This section is organized around issues related to balancing critical loyalty to one's belonging with critical openness to the new as readers (Hansen, 2011), and evaluating the extent to which readers share a cultural match with a book (Johnson, 2016).

Without this positioning of social responsibility, the danger is that readers judge a book based on their culture as the norm, not recognizing that they are reading from their own cultural locations. Cultural mismatches can occur due to unfamiliar story structures, differing uses of literary elements, unfamiliar illustration styles, unknown terminology or names, and lack of knowledge about specific contexts and events. Readers may struggle with books from cultures that use more inference, description, or action than books from their culture. These differences can result in readers rejecting a book as unreadable or feeling condescension and superiority based on their cultural lens, particularly readers who read from positions of privilege due to their country's political, economic, or social status. This positioning can establish stereotypes if readers focus too much on difference and judge characters as exotic or strange. Readers can also fall into the trap of universalizing, failing to recognize the ways in which another culture is unique and differs from their own and so viewing people from that culture as the same "on the inside," a position of colorblindness.

An understanding of the social responsibility of readers is based in a dynamic view of culture, which Geertz (1973) defines as the shared patterns that set the tone, character, and quality of people's lives. These patterns are webs of significance that act as shared codes of meaning between people. González (2005) extends this definition to highlight culture as practice, including what people do, what they say about what they do, and why they do it, which she labels as funds of knowledge. Lived experiences are thus interwoven with identity markers to create cultural locations from which readers interact with books and the world. Cultural locations are dynamic, constantly shifting as readers move across time and place, but remain attached to a core of loyalty to the cultural resources and values in their hearts.

Brooks and Browne (2012) argue that readers engage in culturally situated response, a home from which they make sense of the world and of texts through reading as a transactional process in a dialogue between readers and texts. Responses to a book are always culturally situated and so readers must examine how their cultural locations influence their understandings and the perspectives they bring to meaning-making. Readers, therefore, must be aware of the mismatch or gap between the cultural community portrayed in a book and their own cultural locations and reflect critically on *why* they have a particular response to a book. This awareness involves both naming and reflecting on their cultural locations as readers to critique their biases and assumptions.

Reflective loyalty to the known (Hansen, 2011) challenges readers to search for emotional connections with characters instead of focusing only on personal connections. Encouraging readers to make personal connections to a global book where the experiences and settings are unfamiliar can lead readers to judge that culture against their own, resulting in perspectives of pity and self-importance. Instead, an emphasis on empathy, on finding something within one's self related to the emotions of characters, such as loneliness or fear, invites a stance of listening and connection through "feeling as" (Brown, 2018; Cuff et al., 2016). In contrast, sympathy involves "feeling for" and leads to feeling sorry for someone's misfortunes and wanting to make things better

for them, fueling disconnection and pity from a stance of privilege. Empathy does not assume that one person can fully stand in the shoes of someone else, but that a reader can make an emotional connection to a character whose experiences differ from one's own. More importantly, empathy invites readers to read from a position of shared vulnerability, rather than from a position of privilege.

Reflective openness to the new provides a further challenge (Hansen, 2011). Instead of expecting personal connection, the challenge is for readers to read from a stance of becoming more conscious and committed to others and to moving beyond self to responsible engagement to the other. Instead of reading for pleasure, readers engage with books out of obligation and responsibility to others and accept that the reading may be intellectually discomforting. Socially responsible readers focus on learning from the experiences and perspectives of those whose cultures differ from their own, so they can learn from, not merely tolerate, difference. Further, readers recognize that worlds unfamiliar to them are possible worlds that exist and hold value. Readers thus balance reason with emotion to open themselves to learning from the new (Rosenblatt, 1938). This position of learning from difference may lead readers to engage in further research on cultural contexts and events because of their own recognized lack of knowledge related to a particular book; for example, readers who do not understand the deep roots of racial tension in the US.

Choo (2014) argues that the reader must be willing to engage the other and focus on difference, rather than uniformity, through imaginatively entering the other's world and taking an other-centered orientation. This stance of hospitable imagination involves an orientation of openness *without limit* where readers struggle to understand new perspectives and experiences without imposing judgment from their cultural locations. Choo notes that readers need a home from which to be hospitable, but their openness to the new means they imagine a new reality while still holding on to their own sense of self. Although readers do not let go of themselves to host the other, they are willing to be influenced by that new reality. In opening their minds and immersing themselves in new experiences through literature, readers remain willing to shift their perspectives and accept the possibility of changing their cultural locations as readers and human beings. Wahlström (2014) notes this stance is a tension between resistance and receptivity for readers in a continuous process of both *being* and *becoming*.

Heise (2008) extends this stance of openness to include the universe, earth, and nature, a position of eco-cosmopolitanism. This orientation challenges human supremacy through recognition of the interconnectedness and codependence of humans and the natural world. Heise argues that humans and nonhumans are part of planetary imagined communities, global networks sharing a responsibility based in a sense of planet rather than a sense of place. Her views extend the social responsibility of the reader to becoming open to the experiences of nature through a stance of empathy and learning from nature.

The social responsibility of bookmakers

The words and illustrations in children's books are extensively critiqued in scholarly literature around issues of accuracy, authenticity, and representation. Our focus on bookmakers recognizes that a book is created by a team that includes the author, illustrator, translator, agent, editor, art director, publicist, and others in the publishing company. This team has the same social responsibilities as readers in reflecting on their cultural locations and being open to the other as they create and promote a book. They are responsible to research details of everyday life and language for a global community, understand the core beliefs and values of that community, and explore existing books and media images to determine the currently available representations of that culture. They consider how to balance the individual voice of creative expression within a book with the social good of society, both locally and globally, so that a book does not do harm through misrepresentations of a global culture.

The challenge of availability and access

The availability of global literature is dependent on the books selected for publication, translation, and distribution across global boundaries. Books from countries publishing large numbers of books in English, including the US, UK, Australia, New Zealand, and Canada, dominate the global market, so much so that in many countries the largest percentage of books are translated from English into the local language, providing only a few books that reflect children's own culture. Joosen (2020) states that translation policies have dramatically affected availability, resulting in English books being read all over the world while the rest of the world remains silent and invisible for readers. Seventy to ninety percent of the books available in countries outside the US and Europe are by European and American authors with few books from these countries crossing linguistic, political, and cultural divides to become available in Western markets (O'Sullivan, 2011).

Sixty years ago, Haviland (1961) wrote that European bookstores had too many imports from the US, indicating a problem with the flow of US books. Decades later, this flow has spread to other continents beyond Europe, and the reverse flow of books into the US continues to be significantly lower. English language books dominate because of the accessibility of the English language. The world reads in translation what is first published in English, but English-language countries see little of what the world is publishing in other languages, especially lesser-known languages. For many years in China, picturebooks originally published in English were translated for the Chinese market in enormous numbers, especially award-winning US books. This trend was followed by pairing a Chinese author with an established award-winning illustrator from a Western country. Recently, more books are created by Chinese authors and illustrators; yet it is the rare few that make their way into the English market. This problem of flow is compounded because acquisition editors and publisher teams typically do not know multiple languages and rely on reader-reports from those who read that language and interpret the appropriateness of a book for a new audience.

In examining recent global publication trends, one major upswing is books on trauma. The details of the trauma vary from abuse to child labor to the aftermath of natural disasters and war, from refugees to pandemics to systemic racism. Such books go beyond the individual traumas of death and divorce in earlier books to recognize how worldwide traumas impact children. One major increase due to the global migrant crisis is racially and culturally diverse books reflecting the experiences of refugees. Previously, many of the books addressing diversity were viewed as uniquely an American problem. The displacement of millions of Syrian refugees into areas without much diversity, compounded by large numbers of displaced peoples in other parts of the world, has created an interest in refugee books. Most, however, are written from the perspective of encouraging European and American children to act with compassion toward refugees, instead of depicting children who are displaced acting with their own agency (Vassiloudi, 2019).

Another trend internationally is a rise in the range and style of nonfiction books, especially picturebooks as a place in which the telling of information has thrived. For example, Polish authors and illustrators Aleksandra Mizelińska, Daniel Mizeliński, Piotr Socha, and Wojciech Grajkowski are creating books in a lesser-known language that have become widely translated international sensations. This trend has led to nonfiction categories in illustration competitions and entire bookfairs on nonfiction, such as the Bologna Bookfair where there is a separate category for nonfiction and a 2019 nonfiction conference in St. Petersburg.

One interesting trend is the rise in international collaborations, influenced by international bookfairs and illustration competitions, where publishers become familiar with the work of a wider range of global bookmakers. International competitions such as those sponsored by the Nami Concours in Korea, China Shanghai International Children's Book Fair, and Chen Bochui International Children's Literature Award broaden the possibilities for collaboration. Some authors and illustrators are published first in countries other than their own or published simultaneously across multiple countries. In addition, authors from one country are brought together with illustrators from another, creating a collaboration through a shared international editorial vision.

Books with strong visual images, including picturebooks, graphic novels, and heavily illustrated middle grade novels such as those by Shaun Tan and Liniers, often travel more easily across global boundaries. These books hold appeal because children today are immersed in a visual culture in which images are central to their experiences and interactions, influencing what they know and how they think about the world (Duncum, 2002). Books with interconnected media platforms, including books, films, film, animation, computer games, fanfiction, cosplay, and collectibles, maximize audience engagement and create an increasingly elaborate fictional reality for characters such as Harry Potter, the Moomins, and Alice in Wonderland (Kerchy, 2018). Media provides a new cultural layer and supports more diverse ways of communicating, thinking, and creating.

Another global trend is culturally generic books with universal themes and no location in a specific place and time. Culturally generic books, such as *The Very Hungry Caterpillar* (Carle, 1969), are easy to translate across cultural boundaries and have a large market because they do not challenge readers to move beyond their cultural views. In contrast, culturally specific books combine universal themes with a specific cultural setting in the text or illustrations, and so challenge readers to immerse themselves in another culture and way of thinking. These books, however, can sometimes be difficult for readers in new cultures to understand and so may have smaller market appeal. Uehashi's Moribito series, for example, is very popular in Japan and widely enjoyed by people in Asia, Europe, and Latin America, winning multiple awards. The style of storytelling and grounding in Japanese mythology, however, led to poor sales within the US. The dilemma facing authors from a small country is that writing a generic book can result in large worldwide markets, providing them with financial success, while a culturally specific book connects to experiences of children in their country, but may not be picked up for translation and broader distribution.

Another related issue of availability is the mass marketing of books and related products. Many Western publishing houses are owned by large international entertainment corporations for whom books are only one small segment of their market, and who therefore focus on the child as a consumer rather than as a reader (Hade and Edmondson, 2003). These corporations hope to attract children to any product related to a book that carries the brand's name, such as toys, clothing, games, and videos. These large multimedia conglomerates have a globalizing influence by promoting certain books, such as the Harry Potter series, and their related mass-produced goods across borders, leading to less diversity and more uniformity that threatens regional literature.

The influence of market-driven decisions is challenged by small presses whose mission is cultural diversity and whose decisions about balancing profit margins and losses allow them to concentrate on making the best books, instead of being ruled only by sales and marketing (Settingington, 2016). In some countries, these efforts are furthered by funding from governments and arts organizations to support the publication of children's books about local and global cultures. In Taiwan, for example, the federal government provides funding for local publishers to publish books by Taiwanese authors (Bradford, 2011), some of which are translated for global markets. The efforts and success of these presses have encouraged large presses to take more risks in publishing books set in global cultures.

The availability of a global book within a country does not mean that children get equal access to that book. Who has access varies by the price of books and socioeconomic levels within a country, which determines whether books are affordable. Another issue is whether public libraries and bookstores are present in communities and whether books are easily available in schools and libraries. The availability of a book in different formats, such as an e-book as well as a physical book, also influences access. Finally, access is connected to influencers who promote certain books, such as reviewers, booksellers, bloggers, and award committees.

The challenge of accuracy and authenticity

The social responsibility of bookmakers includes accuracy in details of everyday life and language and authenticity of core values. Accuracy can appear to overemphasize small insignificant details to those who are not from that culture, but those who identify with that culture feel a sense of violation and a lack of respect when details are wrong. Authenticity is more widely discussed because of

the connection to values at the heart of a culture. Although multiple values and ways of living exist within every culture, authenticity focuses on believability, specifically whether a character acts or thinks in ways viewed as possible by those who live within a cultural community. Mo and Shen (2003) point out that although all members of a culture do not share the same values, the themes, beliefs, and actions within a book should fit within the range of values seen as acceptable within that culture.

Authenticity can be viewed through the lens of readers' experiences, particularly when readers from within a culture identify and feel affirmed that what they are reading rings true and is believable, while readers from another culture are able to immerse themselves into the culture and learn something of value about that culture (Fox and Short, 2003). Authenticity also includes the absence of stereotypes or the challenge of commonly held stereotypes about a culture within a book (Yoo-Lee et al., 2014).

Instead of simplistic outsider/insider distinctions, authenticity is more productively viewed as a critical lens for considering complex issues, such as the cultural locations of authors, illustrators, and translators as the most visible members of a bookmaking team. The cultural locations of those who create global literature and the impact of these locations on books indicate the complexity of authenticity and why reducing authenticity to insiders and outsiders or ingroup and outgroup are problematic. These complex cultural locations include:

- Authors and illustrators who live in a global culture and write about that culture for children of that culture, with the books then translated for readers in a new global cultures, such as Maria Parr, Cao Wenxuan, Jairo Buitrago, and Nahoko Uehashi.
 - Translated books are considered authentic sources of lived experiences and perspectives from within a culture. One issue, however, is which perspective or group within a country is the focus and the bookmakers' relationships with that group. Also, readers cannot assume that a translated book was written by bookmakers about their own culture. Translated books can be difficult for children from a new culture to understand due to lack of familiarity and so the translator influences the extent to which a book retains the source culture while also meeting the readability needs of the new target culture.
- Authors and illustrators who live and work across global cultures and regularly move between several cultures, including the culture reflected in their books, such as Suzy Lee, Duncan Tonatiuh, and Yuyi Morales.
 - Their knowledge of multiple cultures provides in-depth understandings of the cultural setting of the book and the audiences reading that book.
- Authors and illustrators who are immigrants and write about their country of origin, such as Ifeoma Onyefulu, Rashin Kheiriyeh, Kashmira Sheth, and Jiang Hong Chen.
 - These bookmakers often access cultural values and knowledge along with awareness of their audience in their current location. Their knowledge, however, can be dated, based in childhood memories, rather than contemporary life in that culture, or, depending on their age at the time of immigration, they may have few experiences on which to draw. Immigrants also tend to write about conflict and violence in their country of origin since many were forced to flee their countries, providing a single perspective of life in that place that can be overgeneralized.
- Authors and illustrators who draw on family heritage to write about the family's country of origin but have not lived in that country, such as Linda Sue Park, Nnedi Okorafor, Margarita Engle, and Adib Khorram.
 - These bookmakers can often tap into core values and beliefs of a culture based on their experiences within their families and have access to resources from their communities and families. They can also lack knowledge about cultural details and need to engage in extensive research.
- Authors and illustrators who live in another country for a significant time and create books from that experience, such as Kate Banks, Holly Thompson, and Katherine Marsh.
 - Significant experiences within a culture, particularly over a long time period, can support in-depth understandings of core values and ways of living as well as access to resources within that culture. Some people, however, live within closed communities and keep themselves separate from the global culture of their location, continuing to judge that culture through their own cultural lenses.
- Authors and illustrators who research a cultural community with which they lack experience, although they may visit that place as part of their research, such as Gill Lewis, J. L. Powers, and Eliot Schrefer.
 - These bookmakers are the most vulnerable to issues of authenticity because they lack in-depth experiences from which to draw. Some, however, engage in extensive research, spend time in a place, and develop relationships with people from that culture to open themselves to that cultural perspective. Also, some are reporters, historians, and anthropologists who draw on their research skills.
- Authors and illustrators who work in collaboration with someone from a global community, such as Omar Mohammed and Victoria Jamieson or Elizabeth Laird and Sonia Nimr.
 - One recent trend is for an author or illustrator who is not from the global culture to collaborate with someone from that culture, so the book is co-created with the goal of accuracy and authenticity in representations.

Simplistic distinctions of insiders and outsiders to a culture are thus no longer relevant in a world where people are constantly on the move. The cultural locations of authors, illustrators, and translators do matter as does their awareness of how those locations influence their work. One trend is for authors and illustrators to include extensive backmatter in books and information on their websites to indicate their cultural locations, relationships, and research. That same information on translators is much more difficult to locate. Ultimately, the authenticity of a book depends on bookmakers' ability to engage in hospitable imagination by opening themselves to understanding and hosting cultural perspectives that are not their own.

One continuing issue across bookmakers is that the audience and markets for most global books is dominated by English-speaking and European countries. Children from a global culture outside of these countries are rarely the intended audience; they are being written *about* rather than *for*. The characters in books set in Africa and Latin America, for example, are frequently viewed through the eyes of a Western child as audience.

The translator is a highly influential member of the bookmaking team for a translated book, yet sometimes is not recognized as such, especially in picturebook translation. Translators are accorded high regard in some countries, while in other countries the translator is not given that respect and may not even be named. Picturebook translators in Japan are highly regarded, such as well-known author, Momoko Ishii, who both writes and translates for children with her work so highly regarded that she is the focus of a book on the child appeal of her translations (Takeuchi, 2014). In contrast, the award-winning *Hiroshima No Pika* (Maruki, 1980) was done as a “rough translation” for the purpose of selling rights, and the American editor (who did not speak Japanese) smoothed out the translation. Three different English translations of this book in three countries have wording choices with significant political impact (Yokota et al., 2007).

Translations allow readers of one language to read books originally written in an unfamiliar language. The goal of the translator is for readers of the translation to have an emotional and aesthetic response parallel to that of readers of the original text (Grossman, 2010). The decisions made by translators are complex with enormous impact on accessibility as well as interpretation for the new audience. The translator must consider verb tense, proper names, humor, idioms, dialogue, what is considered acceptable in illustration, and the voice in which a story is narrated, to name only a few of the many ways a translator interprets a book in a new language for a new audience (Lathey, 2006). The translator must constantly consider foreignizing versus domesticating to balance retaining specific cultural details with changes so readers from the target audience can make sense of the book (Eco, 2001). Children should recognize a book as coming from another culture and expect to struggle with understanding since the culture is unfamiliar, but not to the point that readers are frustrated and abandon the book. What is important to recognize is that translation changes the book’s meaning and to acknowledge that translated books have three creators—the author, the illustrator, and the translator—each of whom has colleagues who support their roles.

Although some believe the language of pictures is universal, illustrations have cultural nuances in visual communication. The limited text in picturebooks may mean that each sentence’s structure, punctuation, font, and placement on the page communicates in a visual way. Illustrations may need to be called to the reader’s attention or explained in ways that are not necessary in one culture (Oittinen, 2008), given that a lack of understanding illustrations can lead to misunderstanding the book. Miyake (2002) argues that picturebooks can be difficult to translate because the simpler the texts, the deeper the roots in culture.

The challenge of cultural representations

A book can be accurate and authentic but problematic in terms of representation, which refers to the relationship of an individual book to the range of available images about a global culture across books and media. When a visual image such as camels and sand in the Middle East, a characterization such as oppressed Muslim girls, or a topic such as the potato famine in Ireland, are overrepresented with few other images available, another book with the same image contributes to existing stereotypes. Issues of representation also arise when only a few books exist about a cultural community, leading to those books viewed as representing the entire culture. Although a book can cause individual harm through inaccuracy and inauthenticity, representation leads to collective harm through the dominance of images that together create stereotypes even when the individual books are not problematic.

One representational issue is power relationships and agency, particularly who solves a problem, such as in refugee books where a child befriends a refugee child within a Western context as a place of safety. These issues of power are also evident in comparison books, where a child’s life in India or an African country is compared to a child’s life in the West, portraying one as a life of poverty in remote rural areas and the other as a life of financial means in a modern urban city. This portrayal is further complicated in that these books portray a comparison of a white child with a child of color, who is found “lacking” by readers, since the audience is typically Western children reading from a position of privilege.

Because Europe and the US dominate worldwide markets, books from these countries that portray life in Latin American and African countries are usually created by bookmakers from the West. Often non-Western countries are portrayed through historical fiction and traditional literature, with few contemporary depictions, and through rural and village settings, with few urban portrayals, leading to misrepresentations and stereotypes of these cultures as set back in time (Gultekin and May 2018; Short, 2018). For example, in the US, middle grade novels about China are primarily set during the time of the Cultural Revolution and picturebooks about Mexico are overwhelmingly set in rural areas of small villages and ranches.

These issues of accuracy, authenticity, and representation in books can establish stereotypes, instead of opening minds to the rich diversity of our world. When readers see a person or event as one thing over and over, they come to see that person or event in a limited way. Adichie (2009) argues that people can be reduced to a single commonplace narrative of who we think they are, rather than who they actually are, what she calls “the dangers of a single story.” Bishop (1990) points out that readers need books as windows into the lives of others as well as mirrors for their own lives. Readers, however, need windows into many rooms to understand a culture and so bookmakers need to be aware of which windows are already plentiful and easy to see through, which are boarded up and difficult to locate, and which windows cannot be found in books. Another complexity is that some windows into a culture need curtains because certain images are not appropriate for specific audiences, such as images of the prophet Mohammed by Sunni Muslims (Gultekin and May 2019) or Hopi stories meant to be told only in a particular season and that should not be written down in books accessible at any time.

The social responsibility of influencers

Adults act as intermediaries throughout the process of creating books and determining the roles of books in children's reading lives. Adults influence whether children have access to books, which books are recommended, and what types of interactions with books are encouraged. Although adults continuously act for children, influencing their reading, their role with global literature is heightened since these books often require more support due to children's unfamiliarity with certain cultures. Adult influencers thus have a social responsibility to readers, whether their role is a bookseller, reviewer, blogger, librarian, classroom teacher, university scholar, or researcher.

Reviewers and bloggers in each country provide perspectives and critiques of new global books that influence purchasing decisions and the perspectives of adults who use these books with children or adults. In addition, the participation of educators and scholars on book award committees leads to public recognition of books named as award winners or on award lists that greatly increase the likelihood of that book's success in being made available to children. Other adult influencers include researchers, university instructors, and educators. These influencers can counteract negative aspects of trends in global markets through affecting how consumers spend their money on books.

Researchers of global children's literature

Researchers both reflect and influence which books receive attention and the perspectives of scholars and educators about those books. Research related to global literature has been cross-disciplinary and the location of researchers within their fields of scholarship influences their research questions and methodology. The three major fields are education, humanities/literary studies, and library science, but researchers from many other fields are involved including childhood studies, history, linguistics, and cognitive psychology (Wolf et al., 2010).

The primary emphasis of research on global literature remains textual analysis of words, images, and design to look closely at "What is this text about?" by interpreting content through a theoretical lens and close analysis of narrative patterns, stylistic devices, and design features. The central goal of this research is examining literature as representations of human experience and asking questions about the significance of what is happening in a book (Stephens, 2015). Much of this research occurs through a critical theory lens, such as critical race theory, postcolonialism, childism, or eco-criticism, used to frame the research process, questions, analysis, and findings. The researcher uses a deep understanding of a specific critical theory to draw key tenets from that theory as a lens for the analysis of a book or set of books in order to think with theory throughout the research process (Jackson and Mazzei, 2012). The methodology of critical reading in literary criticism (Bradford, 2016) and critical content analysis in education (Johnson et al., 2016, 2019) dominates current research, although there are some studies that instead use content analysis to identify themes or characteristics across a set of books, such as the ethnicity or gender identities of characters in award-winning books.

García-González and Deszcz-Tryhubczak (2020) argue that posthumanist and new materialist philosophies provide paradigms for new openings in research that counter the emphasis on language and discourse that dominates the field. New materialism rejects binary categories to emphasize the relational and the complex and highlight processes of becoming rather than states of being as a frame for research with global literature, instead of about this literature. They encourage scholars to "let go of the researcher's gaze and acknowledge our exposure to the relationalities of texts, readers, affects, and matter" (p. 57) and provide examples of research studies from this philosophical perspective.

The International Research Society for Children's Literature (IRSCL) is an international scholarly organization that promotes literary research in children's literature through a biennial World Congress and a scholarly journal, *International Research in Children's Literature*. The organization has members from over 40 countries and seeks to facilitate research across countries as well as the scholarly exchange of research and discussion of professional and theoretical issues. Other journals that publish research in English on the textual analyses of global children's and young adult literature include *Bookbird: An International Journal of Children's Literature* (IBBY), *Papers: Explorations into Children's Literature* (Australia), *Jeunesse: Young People, Texts, Cultures* (Canada); *Barnboken: Journal of Children's Literature Research* (Sweden), *Filoteknos* (Poland), *Libri & Liberi: Journal of Research on Children's Literature and Culture* (Croatia), *The Lion and the Unicorn* (US), *Children's Literature in Education* (US), and *Research on Diversity in Youth Literature* (US).

Although there are some studies of the interactions of readers around global children's literature, this area of research is limited and needs continued expansion, including children's interactions with translated books. National journals in the field of literacy and literature, such as the *Journal of Children's Literature*, or journals with an interdisciplinary focus, such as *Bookbird*, are the most likely places to find this research.

University instructors of global children's literature

Children's literature courses are located in different disciplines within a university, reaching out to students who have differing relationships and interests in these books. Sometimes children's literature is taught within education for students who are teachers or preparing to be teachers. Their interest is not only in becoming familiar with the books and ways of connecting readers with books, but also in developing a critical lens for their reading and that of their students. Courses located within the humanities tend to take a literary criticism perspective with a focus on deep textual analysis of a small group of books, often those considered classics, as separate from children as readers, and are often taught as English literature courses. Courses located within library science tend to take more of a survey approach to acquaint students with a wide range of books to recommend to readers. Courses in the

humanities and library science may be taught for majors in those areas or as service courses for teacher education majors. The perspectives and knowledge that students develop around global literature thus differ by the location of the course.

At the undergraduate level, global literature is frequently one topic or unit within a broader survey course on children's literature, no matter where that course is located, often leading to a surface knowledge of the books and bookmakers and limited understandings of how the cultural lenses of readers influence their understandings. In teacher education courses, global literature is often taught as a tool for teaching something else, such as literacy, social studies, mathematics, or science, overlooking literature as a value in and of itself. One strong emerging area of focus is the use of global children's literature in the teaching of English as another language (Bland, 2013) as well as in the teaching of world languages. In contrast, in-depth courses of global literature support much deeper understandings of the complex issues of culture surrounding books and readers.

Educators in schools and libraries

The social responsibilities of readers and bookmakers inform the work of educators, particularly in their awareness of the potentials and dangers of specific books in relation to the cultural locations of readers and bookmakers. Teachers and librarians, therefore, have responsibility for gaining deep knowledge of the cultural perspectives that students bring to their reading so they can anticipate the ways in which students may struggle or connect with a book set within a cultural community. This knowledge supports educators in creating learning contexts that encourage dialogic inquiry around literature. These contexts ensure that readers never read a book alone, but instead read alongside other books and engage in dialogue with each other to develop a critical lens to bring to reading events.

One social responsibility of educators is to offer instructional engagements that provide a context in which readers can position themselves and the book, learning to question *why* they have a particular response. These engagements include ones that help readers become aware of, and reflect on, their cultural locations, such as creating a heart map of the values they hold most closely in their hearts. This awareness is further supported by engagements that challenge readers to examine the match or mismatch between their cultural location and that of bookmakers, especially the author, illustrator, and translator, as well as to research where a book was originally published and by whom. By engaging readers in strategies for researching the cultural locations of bookmakers and providing frameworks of questions readers can ask themselves related to accuracy, authenticity, and representation, educators encourage readers to develop a critical lens from which to approach their reading of any book.

When students read a global book alone, their tendency is to view that book as representative of an entire global culture, unless they have life experiences within that culture. If instead a book is embedded in a unit of inquiry and read alongside other books and materials, they use intertextuality to consider how texts play off each other and create a context within which they can make connections for constructing understandings of a book. Instructional engagements with paired books and text sets help readers view a book within a broader representational context for a cultural community and can create a sense of connection and difference across global cultures. Pairing a book that is culturally distant with a book that is culturally near may build conceptual bridges. Readers can also be encouraged to research additional information in the library or on the internet to place a book within a broader context.

Another aspect of social responsibility for educators is creating contexts that encourage intercultural dialogue between readers. Dialogue involves readers walking alongside and talking with, not at, others to wrestle with issues instead of walking on the surface of those issues (Freire, 1970). Dialogue combines critique and inquiry, as readers pose questions, challenge the status quo, and collaboratively consider multiple viewpoints on an issue. Freire (1970) argues that dialogue has the most potential for societal transformation by combining love, humility, faith in others, hope, and critical thinking (p. 72). Dialogue strategies, such as webbing issues or selecting a memorable quote, encourage readers to reflect deeply on a book in order to find issues they consider significant, instead of being guided by what a teacher has already identified.

Resources on global literature

For those who want to become more involved in the field of global children's literature, a wide range of resources exist, including international organizations, bookfairs, awards, and scholarly overview projects. In addition, there are many national organizations and awards, but our focus is on those that are international in scope.

Although most countries have libraries that house their country's literature, only a handful strive to internationalize their holdings to showcase the world's literature for children. The most significant is the International Youth Library, which offers international opportunities within and beyond their location in Munich, such as traveling exhibitions that make their way around the world. "Hello, Dear Enemy" has been traveling the world for more than two decades, with updated iterations of new books. The IYL Fellowship program brings together researchers from around the world who rely on the world's largest collection of international books to conduct research and weave together international understandings. The White Ravens Recommendation List features notable books from around the world that are singular in distinction and deserve international awareness.

The International Board on Books for Young People is an organization that brings together those involved in the creation and dissemination of literature while supporting activities for literacy promotion. Eighty-one national sections share common goals of building relationships to promote literature and literacy, encouraging international understanding, and sharing ideas and resources in regions of high need, along with administering awards that feature the highest recognition for achievement. The Hans Christian Andersen Award highlights a nominee list of authors and illustrators regarded by different countries as their best; the winners feature

those recognized as the best among the best. The IBBY Honour Books for writing, illustration, and translation are nominated by member nations who recognize their own best literature; likewise, each IBBY award shows selection and support by their own countries. What counts as “best” is an elusive definition made difficult across cultural perceptions but left to the decision of each country and then judged by an international jury; this two-tiered system balances the national with the international. Every two years, a World Congress is held in a host country allowing members from around the world to come together to share book creation and research, celebrate literature and literacy initiatives, and engage in discussions to further collaborative efforts of mutual goals.

First held in 1964 with European exhibitors, the Bologna Book Fair has blossomed to participants from all corners of the world reaching large international audiences of visitors and publishers. The primary goal is for the sale and purchase of foreign rights and the introduction of authors, illustrators, and translators across international borders, along with increasing opportunities for digital media and communication. The physical exposure to books and their creators and opportunities to engage in discussion make international book fairs a unique place to see what the world is publishing. However, this fair is dedicated to selling rights, and what sells rules decisions about displays in booths. For example, Disney, Nickelodeon, and other media-driven books are prominently displayed whereas more literary works are seen by appointment. Often, the emphasis is on the rights to generic books with artwork that transcends cultural specifics and minimal text that is easy to translate. Sell-ability dominates over unique distinctions. Although the Bologna Bookfair is the oldest and largest international fair, other large book fairs occur around the world, such as in Shanghai, Moscow, and Guadalajara.

Book awards are another resource for locating global literature, particularly works of notable quality. The IBBY Hans Christian Andersen Award is the oldest lifetime achievement award. What makes it distinct is that nominees are named by individual member nations, and an international jury selects from among those nationally nominated authors and illustrators. In a sense, the nominees are themselves winners of the nomination from their own countries. The Astrid Lindgren Memorial Award is presented by Sweden and is considered a generous monetary gift in honor and memory of Sweden’s most famous writer, Astrid Lindgren. Nominations of authors, illustrators, or literacy organizations are made by officially ordained nominating bodies from around the world, and, because they are not limited to their own countries, some are nominated simultaneously multiple times.

The most well-established awards from book fairs are the Bologna Book Fair Illustration Exhibition that goes on tour for two years and the Bologna Ragazzi Award for best book design. The China Shanghai International Children’s Book Fair has the Golden Kite illustration competition and exhibition as well as the Chen Bochui Literary Award. Some countries value children’s literature so much that they host international exhibitions with competitions to encourage the highest quality literature for children. Biennale of Illustration Bratislava (BIB) has the support of the Slovak Ministry of Culture, and the cooperation of embassies from around the world. What is striking to note is that submissions from English language countries are few in number, providing a more global scope.

Finally, the perspectives of scholars, especially literary critics, are available in handbook and encyclopedia projects. *The Routledge Companion of International Children’s Literature* (Stephens et al., 2018) is organized around broad themes to highlight scholarship from Africa, Asia, the Caribbean, and Latin America and to reconsider Euro-centric scholarship often held as the standard of the profession. *The Edinburgh Companion to Children’s Literature* (Beauvais and Nikolajeva, 2017) focuses on current directions in children’s literature scholarship, contemporary trends in the literature, and future unmapped territories. In contrast, *Handbook of Research on Children’s and Young Adult Literature* (Wolf et al., 2010) is a collection of interdisciplinary essays on literary reading, texts and context across the fields of literacy education, English literature, and library sciences, written by scholars and children’s authors.

Conclusion

In writing this state of the art in global children’s literature, we are aware of the caution offered by Fraser’s analysis of the state of the field of international literature in 1981. Fraser critiqued the work of scholars, noting that even though they avidly advocated for this literature and its merits, their work was based in the belief that books for readers in English language countries originate in the English language. Fraser’s own analysis, however, failed to recognize that her examples were European, indicating her assumption that international was synonymous with European literature. We are aware that, in the future, our own analysis will be shown to be limited by our current world views, experiences and conversations in the field.

For us, global literature holds significance because of how those books play out in the lives of children, both in helping them critically examine their cultural assumptions and values and in opening themselves to alternate values and perspectives. Global books influence how children view the world and its complexities as they figure out their places and functions in the world they have come to know. Children’s engagements with literature hold the possibility of transforming their world views through understanding their current lives and imagining beyond themselves. If their reading only mirrors their own views and cultural communities, children have difficulty envisioning alternative ways of thinking and being, essential to the societal transformation that Lepman (2002) dreamed about so many years ago.

Overview

When and how did it start?

In this region, increasing social awareness about the importance of books for young readers, the growth of the book publishing industry, as well as the intervention of governments through reading policies, massive book purchases for public libraries and schools, as well as widespread primary instruction set the basis for children's literature to develop with force toward the end of the 20th century.

If we consider industrially produced and commercially distributed texts for children in European languages and traditions, we can say children's literature in Latin America started during the early 16th century with a few titles imported from Europe and even fewer written and printed in Spanish and Portuguese America. The area witnessed sustained growth of local production of children's literature since the early 19th century. Nowadays it is the sector of the publishing business which has most potential growth.

But if we are to consider those orally produced and transmitted texts in the indigenous languages and traditions of the region, however, we must acknowledge that children's literature had a much earlier inception. If we take into account those oral or written texts which originally belonged to European, African or Asian literatures and lore, but were adopted and developed locally, a rich heritage children's literature in Latin America is unveiled. The region is a living repository of multicultural and multilingual corpora that interact in several ways. The texts of this complex heritage have social uses beyond reading, for children's literature is performed in play, community rituals, feasts and celebrations in the forms of dance, prayers and incantations, singing, drama and storytelling.

There was, since the beginning of colonial rule during the 16th century, a local production geared to the instruction of aborigines in the language and religion of their conquerors, often in bilingual editions. Among the first printed books in Spanish America were catechisms in Nahuatl, the language of the Aztec, and in Quechua and Aymara, languages of Perú, as early as 1539 and 1583, respectively. The first textbook to be used in America among young readers presented a selection of Aesop's *Fables* translated into Latin and Nahuatl, in the first higher education school for young natives in the Continent, the Colegio de la Santa Cruz in Santiago de Tlatelolco, established in 1536.

Noteworthy in this early production are educational efforts to produce pictographic prayer books in which two very different communication systems, world views and ways of representation are combined (see Figs. 1 and 2). Instead of words, the reader finds drawings set in the lines of a page to be read top-down and from left to right, as in a European book. These pictographic texts communicated Christian concepts through images which the aborigines could read metaphorically. The colonial policy of imposing one way of reading—virtually nullifying interest in the semantics of these visual languages and literally destroying monuments and codices—meant that Latin American children lost cognitive access to a vast repertoire of indigenous texts that are extant.

During the 1st centuries of colonial rule, reading books for beginners, prayer books, fables and adaptations of Greek and Latin texts were mostly imported from the Metropolises. The prohibition of novels in Spanish dominions; the unequal introduction of the printing press and of universities in the region and restrictions imposed to printing and the free expression of ideas explain in part the early limited development of imaginative, pertinent and locally situated literature for children and the tardiness of the

formation of what could be called a literate society. Neither Spain nor Portugal had a strong tradition of books for children, so what circulated in their New World colonies were mostly adaptations and translations of French works such as Reyre's *Lami des enfants*, Fenelon's *The Adventures of Telemachus*, a Christian rendering of Odysseus' son's quest or, more rarely, the works of some of the imaginative authors of the French Enlightenment (see Fig. 3).

The first Latin American novel, José Joaquín Fernández de Lizardi's *El Periquillo Sarniento* (1816) dealt with the problems of being born and educated in the decadent final years of colonial rule in New Spain (see Fig. 4). Among highlighted problems related to rearing children that the novel analyzes is the scarcity of good reading books for them (see Fig. 4).

Nevertheless, not all the flow of new ideas depended upon books. Among other strategies, staged plays were used in the Spanish and Portuguese dominions to spread Christianity. Through mystery and Nativity plays, and later "*Comedias de magia*" (magic plays), elements of medieval theater and later a selected corpus of Gilded Age and Baroque characters and plots entered popular spectacles and culture (Carranza Vera and Silva Martínez, 2017, 10–13). In Brazil Jesuit José de Anchieta, the "father of Brazilian literature," catechized Indians through plays he wrote to that purpose. The scenography resources with which such works were staged opened the way for eerie ambiances and plots, imagination, magic, miracles and phantasy. This had effects on popular children's culture. It also paved the way for puppet theater companies for children in different countries of Latin America along the 19th and 20th centuries. *Pedro y su teatrino maravilloso* pays homage to this activity (Rubio, 1993).

Local production of children's books during colonial times was forged in European molds and had religious, moral and educational ends to which an amiable style, typography and illustration contributed gradually as technology advanced. Children's literature is a phenomenon that in Latin America started to flourish in the early 19th century, as part of the cultural revival called for and spurred by Independence movements, the first of which was that of Haiti in 1794 and last that of Cuba in 1898.

Newspapers and books during the 19th century were seen as vehicles to instill in children civic ideals such as freedom and equality as well as love of country and of learning, by providing readers with accounts of natural sites, cities of splendor, memorable historical facts and the admirable lives of heroes of each nation and of the region. Atahualpa, Cuauhtémoc, Andrés Bello, Simón Bolívar, José María Morelos and Benito Juárez, to name a few, were paid homage in children's literature. Contemporarily, the ever-present cult of heroes in children's literature incorporates not only individuals or groups considered political heroes as Francisco

Fig. 2 Anonymous. *Borgia Codex*. XVth century. Page to be read clock-wise.

Miranda or César Chavez, but also those of other walks of life such as sports and music, as well as writers, dancers and other artists. *Tito Puente, rey del mambo* (Brown, 2013) is a case in point.

Printed children's literature appeared in different countries with varying paces and vigor. Most probably the first periodical publication for children in the region was *El Correo de los Niños* (1813), edited by Wenceslao Sánchez de la Barquera in New Spain; *El Periquito* (1868), was one of the first Cuban children's periodicals (Guadarrama Olivera, 2000); *El Atomo* (1888) was the first children's periodical in Guatemala (Lozano Alvarado, 114–116). Mostly short lived, initiatives for children during the 19th century suffered from economic and political instability that thwarted cultural and economic initiatives.

Throughout the 19th century periodicals and books for children in Latin America followed French, Portuguese, Spanish and sometimes English or North American models, gradually granting more space to local news and themes, authors, and illustrations, contributing in this way to the creativity, originality and relevance of children's literature. The local industry geared to produce books for children was slowly built in Latin America, where European entrepreneurs played a seminal role as printers, editors and distributors. In time, in some countries, together with imported merchandise, the basis to cater to young readers within a local publishing industry nourished by national authors and local printing shops was established. For example, several businesses coexisted in Brazil during the second half of the 19th century: the locally owned and operated *Livreria do Povo*, of editor Pedro Quarasma, the German owned Laemmert, the French Garnier—which operated from Paris in different points of Latin America—and the business of Francisco Alves, a Portuguese publisher (Fioravanti, 2013). The first printing shop and bookstore for children was José Rosas' *Imprenta y Librería de los Niños* (1873–75) in Mexico City (see Fig. 5).

The longest-lived initiatives in children's periodicals in the area are *El Peneca* (1908–1960), printed in Chile and read in several countries of South America, and the monthly *Billiken*, founded in Argentina by Constancio C. Vigil, which has been published since 1919 to our day, an unparalleled feat in the region. Starting in 1950 this monthly magazine was exported to Uruguay, Paraguay, Venezuela, Puerto Rico and Bolivia. It evolved with the times, dodging and sometimes supporting or turning a blind eye to censorship from authoritarian regimes, struggling for a share of the market in competition with North American comic books translated and printed in Mexico by Editorial Novaro since post-war time onwards (Díaz Rönnner, 2000, p. 523), when the United States endorsed the development of cultural initiatives in the publishing and film industries in that country as a buffer to communism.

Who are some of its main authors and what are its historical and current trends?

Writers, editors and illustrators of children's literature in Latin America strive to find and offer their own voice and esthetic values in a multicultural and plurilingual literary tradition woven with many threads, in a society with numerous needs. Increasingly public and private cultural, educational and welfare institutions have participated in projects geared to encourage the creation and promotion of children's literature. There is today an increased specialization in professions related to publishing in this field.

Although there are in fact several precursors of children's literature as it is understood and practiced in each country today, certain authors captured the public's imagination as the founders of each country's production. Such is the case of Rafael Pombo

Fig. 4 José Joaquín Fernández de Lizardi. *El Periquillo Sarniento*, Mexico, Imprenta de Galván, 1816. Metal engraving.

and his fables in Colombia; Alberto Figueredo Pimentel (1869–1914), Alexinha de Malghães Pinto (1870–1921) and [José Bento Renato] Monteiro Lobato (1882–1946) in Brazil; José Rosas Moreno (1838–1883) in México; José Martí (1853–1895) in Cuba; Horacio Quiroga (1878–1937), Juana de Ibarborou (1892–1979) and José María Firpo in Uruguay (1916–1979); José Sebastián Tallón (1904–1954) and María Elena Walsh (1930–2011) in Argentina; Carmen Lyra (1887–1949), Luis Carlos Sáenz (1889–1983) and Adela Ferreto in Costa Rica; Concepción Leyes de Chávez (1891–1985) and Josefina Plá (1903–1999) in Paraguay; Carlota Carvallo de Nunes (1909–1980) in Perú; Salomé Ureña (1850–1897) in the Dominican Republic; Elvira Santa Cruz Ossa (1886–1960) in Chile; Manuel J. Calle (1866–1918) in Ecuador; Adela Zamudio (1854–1928) and Nataniel Aguirre (1843–1888) in Bolivia; Daniel Armas (1897–1983) and Marilena López (1902–1980) in Guatemala; in Panamá Luisita Aguilera Patiño (1914 to our day), Hersilia Ramos de Argote (1910–1991), Gonzalo Brenes (1907–2003) and Rogelio Sinán (1902–1994); the contemporaries Salarrué (1899–1975) and Claudia Lars (1899–1974) in El Salvador; in Puerto Rico, María Cadilla (1884–1951); Teresa de la Parra (1889–1936) and Rafael Rivero Oramas (1904–1992) in Venezuela; José Trinidad Reyes (1797–1855) in Honduras.

The phenomenon of authors devoted to writing or illustrating for children or youths is, with exceptions, more a 21st century phenomenon. National, regional and international prizes have contributed to form a sizable group of children's literature authors and illustrators. In spite of insufficient translation and distribution of the works of Latin American authors for children both within

Fig. 5 Children's Printshop and Bookstore (1873), the first specialized enterprise in the region. Metal engraving. Source: José Rosas Moreno, *Los Chiquitines. Diario Infantil, Joco-serio, con Estampas y Caricaturas*. México: Imprenta y Librería de los Niños, 1874.

Latin America and in the world, contemporary writers and illustrators such as Maria Teresa Andruetto, Ana María Machado, Isol Ziraldo, José Mauro de Vasconcelos, Lydia Bojunga Nunes, Carmen Leñero, Adolfo Córdoba, Antonio Orlando Rodríguez, Vicky Ramos, Jorge Luján, Micaela Cherif, Martha Riva Palacio, Monica Doppert, Roger Mello and Fabrizio Van den Broek, to name only a few, have won international prizes that grant them recognition as artists in the region and beyond.

We find Nobel prize winners of Latin America who devoted part of their endeavors to young readers, as the *Rondas* of Gabriela Mistral, Pablo Neruda's monumental *Canto General* written for youths of the region, Rigoberta Menchú Tum's *El legado secreto* (2016), or Miguel Ángel Asturias' *Leyendas de Guatemala*. Canonical authors all over Latin America have written for children, as did Paraguayan Augusto Roa Bastos in *El pollito de fuego* (1974), Sergio Ramírez in Nicaragua with *La jirafa embarazada* (2013), Clarise Lispector in *Quase de verdade* (1978), or Jorge Amado's *O gato malhado e a andovinha Sinhá* (1948), to name a few. When the most famous authors have not engaged in children's literature, selections and sometimes adaptations of their works have been traditionally refunneled to children.

Children's literature and textbooks have been thought instrumental to achieve the social conditions adults strive for. Not uncommonly, authors have had religious, ecological, political or various instructional ends when writing for children. Trends in adults' affairs tend to shape the production of children's literature as is the case, for example, of sustainable growth nowadays (CERLALC, 2020). Thus, to our day texts for children have often had in view not only literary considerations but also or mainly educational as well as political contents and goals.

Different political ideologies and forms of didacticism have shaped children's literature in Latin America, site of invasions, revolutions, counter-revolutions and dictatorships, each with consequences for the development of the lives of children and the books that are available for them to read. Regimes have seen in literature a venue to attain unconditional support and in youngsters a vehicle for social change, renovation or control.

The will to control the ideological orientation of texts for children to read and learn is well entrenched in Latin American culture, at least that of Spanish origin. The earliest colonial policies for children's education prohibited instruction devoid of religious orientation: "*No instruir sin catequizar*" (no instruction without religious content). The first Council of 1555 in New Spain was earlier than the Council of Trent in what pertains to the control of printed texts, which specifically called for never teaching children to read without concurrently teaching them the basic principles of religion (Fernández de Zamora, 2008, p. 111).

Nationalism became one of the literary antidotes for colonialism and neo-colonialism. Thus, in 1901, for example, Heriberto Frías wrote about the Spanish, French and North American invasions of the 16th and 19th centuries in *Biblioteca del Niño Mexicano*, a series of 100 booklets, published by Maucci Hermanos, a Catalan publisher which had business in several countries of Latin America and Manila (see Fig. 6).

The 20th century revolutions of Mexico, Cuba and Nicaragua carried out impressive literacy campaigns and created series of children's books known as *Libros del Chapulín*, in Mexico, *Editorial Juvenil* and *Gente nueva* in Cuba, *Nueva Nicaragua* in that country. The 1944 Revolution in Guatemala produced the first modern children's magazine in that country: *Alegría*, which was censored by the counter-revolution (Maldonado de Masaya et al., 2011, pp. 12–13). The cases and modalities of censorship in Argentina, Chile, Colombia, Cuba, Guatemala, Mexico, Venezuela as well as Spain during the 20th century are well documented (Cerrillo and Sotomayor, 2016).

Other ideological orientations have acted upon children's literature in Latin America. Disney's overtake of children's imagination was decried in children's literature, for example, in *Ratón Pérez contra Ratón Miguelito* (see Fig. 7); it was dissected in *Para leer al Pato Donald* (Dorfman and Mattelart, 1971). Cultural diplomacy and policies of political propaganda from China and Russia reached

Fig. 6 Heriberto Frías. *Biblioteca del Niño Mexicano*, Mexico, Maucci Hermanos, 1910. Color lithography.

Latin America as systematic and useful arms of foreign policy (Ratcliff, pp. 53–79). Books for children, some by leading writers who exalted harmony in cooperative living, were in this way available in Spanish and Portuguese through literally millions of copies of beautifully illustrated Russian and Chinese books at very low or no cost from Progress Publications, based in Moscow, and Foreign Language Publishing House, in Beijing (Prashay, 2019).

Literature for children in Latin America tends to have this age group as protagonists, or recounts childhood memories, as well as the lives and works of individuals of historical relevance. It dwells on local myths or appropriations of international folklore. Poetry for children is practiced all over the region. Storybooks are favorites, and growingly novels, including graphic novels. Theater has been cultivated as a continuous undertone, with special predilection for puppets. Under the label “children’s lit” fall also, though less frequently, texts written by children. There are more works for young readers that are historical in perspective than those which offer a prospective or futuristic outlook. Outside picture books, few are abstract or conceptual. Texts for children tend to be more didactic than playful or poetic. Translations and adaptations of regional and international classics and contemporary works nourish what children read. There is a larger participation of women writers, editors and illustrators for children’s books than in others specialties, often in multiple capacities. Yuyi Morales, Beatriz Ferro, Isol, Ricardo Liniers and Christian Palacios are among those contemporary multifaceted professionals.

According to scholar Guerrero Guadarrama (2016), contemporary Latin American children’s literature critically re-reads old artistic molds subversively, irreverently, with humor and irony. It makes use of resources available in different genres and traditions to touch upon what traditional societies consider controversial topics when addressing children: divorce, adoption, mental health, sexuality, ageing, violence. It questions gendered behavior by playfully reversing or questioning roles. According to her, one of its most interesting current forms is the “unearthing of memory” in countries with a recent history of authoritarianism. Some have installed commissions of truth to reconstruct those periods, as is the case of Uruguay, Argentina, Chile, El Salvador, Guatemala, Perú, Paraguay, Colombia, Ecuador, Honduras and Brazil. Writers María Teresa Andruetto, Laura Devetach, Graciela Montes and María José Ferradas, among other winners of the S/M Iberoamerican Prize of Children’s and Youths’ Literature, have addressed part of their works to this reappraisal in a region where historical narratives account for a large part of all the writing geared to this age group.

Along the 20th century the notion that to achieve full literacy children need to find pleasure and some form of utility in reading texts that are written for them took force. Nowadays equally potent is the shared conviction that the texts children read should help them to perform freedom, gradual moral autonomy and a critical view—not obedience and conformity to unquestioned or unexamined social beliefs and values as they are traditionally embodied in historic or contemporary renditions of didactic literature.

Fig. 7 Miguel Ángel Bayardi. *Ratón Pérez contra Miguelito*. Illustrated by Dagoberto Dinorín, México, Secretaría de Educación Pública, 1945. Ratón Pérez is a traditional Spanish children's story character.

Given the role of children's literature in literacy, it is considered a key input in the development of psychomotor skills as well as in motivating students and enabling them to stay in school with good academic achievement. Furthermore, children's literature is expected to spark self-knowledge, critical thinking, social empathy and civic awareness, as well as to provide elements of personal, national and regional identity together with a sense of cultural and linguistic pride, in addition to providing models for healthy and sustainable lifestyles. This is a tall order for literature, although the availability of good texts together with skilled mediation can in some way contribute to individual actions and social policies that have these aims.

In Latin America the appreciation of the role of the “mediator” between child and book is evolving into a social and professional practice that involves librarians, teachers, parents and grandparents, older siblings, youths and others who are interested in contributing to those goals by creating reading communities in which participants hear stories, read out loud, share reading experiences and write their own texts so in that process they learn to select books, enjoy literature, express themselves orally and in writing, bond with fellow readers and have tools to deal with their everyday experiences. Mediation has a long history in the region, and its own heroes. One of them, Colombian rural librarian Luis Soriano, is the inspiration for Monica Brown and John Parra's picture book *Waiting for the biblioburro/Esperando el biblioburro* (2011). Argentina's writer María Cristina Ramos, winner of the Organization of Iberoamerican States and S/M Children's and Youths' Literary Award (2016) as well as runner up for the Hans Christian Anderson Award in 2020, is also a *mediadora*. Different institutions are engaged in mediation and cater to professionals and para-professionals who engage in it. The Pura Belpré Award honors the Porto Rican librarian, writer, folklorist and puppeteer who excelled in making available and palatable Latin American children's literature to Spanish speaking young readers at the New York Public Library.

Publishing for children is a way to tap a growing market nourished by national laws and social efforts for universal education. Children's literature in Latin America is, in that way, a product of global commercial and cultural exchanges that take place in asymmetrical conditions among different social groups as well as among hegemonic and peripheral nations. Nowadays, the books children read in Latin America come in large proportion from the United States, Spain, Portugal or those that are printed in regionally installed subsidiaries of American and European companies. Printing takes place in large numbers in China, Hong Kong and South Korea. In 2014, only 45% of authors of children's literature that circulated in Latin America were from the region (CERLALC, 2014, p. 62). The slow-down of publishing in Spain has been compensated by larger sales in Latin America (CERLALC, 2008, p. 88, 90–91).

Together with pedagogical and commercial practices, several factors have been and are central in configuring this field, among them the range of technological media and social practices available for writing, editing, printing, illustrating and distributing texts; general trends in the development of the fields of Literature, Education and Psychology, together with the goals of national education systems and their policies to extend reading and promote social agendas related to children's rights. There is a diversity of settings and conditions where children's lives develop: some of them live with the values and practices of modern societies while others dwell in more traditional, though evolving, settings. Access to education and books in those contexts is not the same. White Ravens' prize winner Claudio Aguilera's *9 kilómetros*, for example, describes the road a child has to walk to get to the local rural school; Chilean Marta Brunet's (1897–1967) and Salvadoran Salarrué's (1889–1975) works touch upon or center on *campesino* (peasant) stories.

Far from being idyllic, children's life in Latin America and the Caribbean is afflicted by poverty, malnutrition, conflict, exclusion, migration, child labor and parental informal employment or unemployment. According to UNICEF, in 2020 there were 188 million children and adolescents in the region, 7.9 million of which were migrants and 12 million were out of school systems (UNICEF/LACRO, 2020). Children's literature writers address these problems in various formats and genres: picture books, poetry, novels, stories, comic strips, songs and graphic novels in paper or electronic devices, in intermedial treatments, videogames and films all of which are venues for communication with young audiences while, at the same time, they are vessels to instill values and learning. In this sense children's literature can be examined for its social representations of childhood and youth.

There is a long tradition of visual communication of ideas in Latin America, both for adults and children, rooted in the ancient local traditions of mural painting, *stellae* and *codices*, a tradition which has had different modes, purposes and moments. Some of them are *aleluyas* (series of stamps with verses in the Spanish tradition), *monitos* (comic strips), *cuentos* (serial comic books in the Japanese, Franco-Belgian or North American traditions, as well as local talents and traditions as *Mafalda*, *La familia Burrón*, *Kalimán*, among others), *fotonovelas* (photographic novels) and, today, graphic novels.

In this last, flourishing genre, there are several lines of development. There are books that interpret for children, with the interplay of text and image, the lives and works of cultural heroes, like writers Jorge Luis Borges, Gabriel García Márquez or Juan Rulfo, in the works of Óscar Pantoja/Felipe Camargo and Nicolás Castell, alongside others that depict and analyze difficult historical moments of contemporary Latin American history, as *Tortas fritas de polenta* (Martinelli/Bayúgar, 2014), 2021; the anthology *Las otras islas* (Birmajer et al., 2012) about the war between Argentina and England over the Malvinas/Falklands islands; the short lived regime of Salvador Allende and the ensuing military coup that overthrew in *Los años de Allende* (Reyes and Elgueta, 2015). Japanese immigration is explained in *Los samurais de México* (Ueno/Sakuya, 2018). The challenges of growing up in Latin America are examined in works as *Diario de Un solo* (Bustos, 2016), or in *Virus tropical* (date), of Colombian-Ecuadorian author Powerpaola (Gaviria, 2018), available also in movie version. The genre engages with national and international literary traditions in *Mocha Dick: la leyenda de la ballena blanca* (Ortega, 2016), a mixed narrative of Moby Dick and the whale that appeared in Chilean Mapuche coast that inspired Melville.

Another form of visual communication that is steadily gaining authors and readers are *libros album* (picture books), narratives where artistically rendered images take the place of words. Social critique and understanding are furthered in graphic narratives as *Morro de favela* (Diniz, 2011), or in *Camino a casa*, that combines written and visual narratives (Buitrago, 2008). The small issues of a very young child's day are addressed in albums like ¡Él empezó!/He started! (Keselman, 2006). Other albums, an example of which is *¡Es una travesía esa raya!* (Leñero, 2001) have a more conceptual bend. “Album books” in Latin America, given their artistic qualities, have captivated adult readers too, as do graphic novels.

In Latin America, paper is still more prevalent than digital supports for children's literature, although there is an upward trend toward more use of digital supports, including those with some interactivity (CERLALC, 2014, 62). A silver lining of the recent Covid-19 pandemic is that large numbers of schooled children are now used to reading e-books. On the down side, exacerbated

poverty and unequal access to education due to this disease make inaccessible these media and even printed books to many young readers (OREALC et al., 2020).

What is its relationship to other literatures of the world?

Latin American children and writers are heirs to multiple literary traditions of different world cultures through the Spanish and Portuguese languages. The Spanish empire extended all the way to the Philippines; the Portuguese empire included Angola, Mozambique, Cape Verde, Goa and Macao. Furthermore, imbibed in Arabic and Sephardic traditions, rooted in classical Judeo-Christian and Greco-Roman texts as well as part of those of ancient Carthage, India and Persia, the Spanish and Portuguese literatures that arrived to the New World—at the time Jews and Muslims were expelled from Spain and some sought refuge in Portugal and America—are a rich mix of topics and genres that took root in novel soil.

The elites of the colonies and later independent states of Latin America have traditionally had full access to the currents, trends and authors of the Western canon, including children's repertoires, for more than 5 centuries, be it directly or in translations and reappropriations of texts for children or adult readers.

Popular culture receives the western canon and transforms it in a different way. One well-studied example of the new life given to ancient texts in an entanglement of literary traditions is *Fierabrás*, a *chanson de geste* originally composed in French toward the end of the 12th century, which was translated into Castilian as *Carlomagno y los doce pares de Francia* in 1521, immediately becoming immensely popular in Spanish and Portuguese colonies to the point that "it became part of the blueprint to build a new religiously and culturally hybrid society in the Americas and the Philippines" (Grinberg, 2012, p. 139).

The concept of opposition between two forceful characters found in the performed representation of the bloody and cruel Battle of Roncesvalles, fought in 778 by Charlemagne against Turkish forces, became a causeway for original binary pre-Hispanic conceptions all over the region, danced to music and dialog. It is likely that in the literary rendition of this battle young readers found a metaphor and the basis for their elders' performance of a tradition of rebelliousness, subversion, confrontation and taking action for a community (Flores, 2009, pp. 100–101).

All over America there are versions of tales of the battles and skirmishes between two animals, one large and mighty and the other small and meek, but crafty: *Macho Ratón* in Nicaragua, *Conejo* and *Coyote* in México, *Br'er Rabbit* in the United States, *El zorro y el sapo* in Perú, *Tío Conejo* and *Tía Boa* in Costa Rica, *Tío Tigre* and *Tío Conejo*, known to children in several countries. Most contemporarily, the tale has been retold in *Pancho Rabbit and the Coyote* (Tonatiuh, 2013) to address migration.

Commerce of ideas in the field of children's literature during the 19th and 20th centuries can be seen in the case of the development of British Arthur Mee's *The Children's Encyclopedia*, reworked and re-edited in the United States as *The Book of Knowledge* (Jackson et al., 1912) which had several editions in different languages and countries, including China and Russia, as well as *Tesouro da Juventude* for Luso-Brazilian readers and *El tesoro de la juventud* for Spanish speaking countries.

If we compare the *Tesouro* with *El Tesoro* we see that each is not only a version in Portuguese or Spanish of *The Book of Knowledge* but, from the viewpoint of this article, a quite different edition, given that each offered its own repertoire of children's literature. Furthermore, the Portuguese language edition did not have a permanent section on "Latin America" as did the Spanish language edition which featured it in each of its twenty volumes (Riesco, 2008, 198–225; de Oliveira, 2018, 105–128).

Different currents of migration have defined life in Latin America. Its vernacular linguistic diversity bears witness to the multiple origins and the resilience of its first inhabitants; afterward, there has been a continuous flow of European, African, Oceanian, Middle Eastern and Asian immigrants as the result of colonization from the 16th to the 19th centuries, and again during the 20th century, when Latin America was haven for those who fled two world wars and their human, economic and political consequences.

Many Latin American individuals and families have, in their turn—notably after the second half of the 20th century—migrated in search of a better life both within Latin America and to other regions, mainly North America and Europe, thus constituting linguistic communities abroad that among many other needs require reading materials for children in their mother tongues. The first Chicano novel, *Las aventuras de Don Chipote o cuando los pericos mamen* (Venegas, 1999) speaks of this kind of displacement. Contemporarily there are compelling accounts as *Migrar* (Mateo and Martínez, 2012) or *Somos como las nubes/We are like the clouds* (Argueta, 2016).

The widespread phenomenon of migration has spurred a market for Latin American children's books in regions outside of Latin America. There is a notable growth of authors who write in English for children whose mother tongue, tongue of heritage, tongue of instruction, or second language is Spanish or Portuguese. These authors take topics of both the Latin American traditions and the migrant and first-generation American experience together with elements of oral language as code-switching or sprinkling words in either of those languages into a text that is mainly in English. Several prestigious awards acknowledge and stimulate this production, among them The America's Award, first discerned in 1993. Among the recipients are Francisco Jiménez, Francisco X. Alarcón, Jorge Argueta, Alma Flor Ada and Gary Soto.

Latin America has contributed to world thinking and rethinking of fantastic, improbable, unthinkable and un-to-fore unimagined worlds. This region has been seen in world literature as the site of actual or potential utopia, a locus of the fight for freedom and the renovating winds of revolution, as well as of innumerable sources of wealth. It is also the origin of topics, genres, characters and settings.

Early to 19th century European texts that spoke of Latin America eventually made their way to European children's literature and in time reached the children and youths of America, who read about their land through eyes that were not theirs. For example, Lucien Biart's *Aventures d'un jeune naturaliste* (1869)—mentioned by Rudyard Kipling's character Kim as one of his favorite

readings—puts down local inhabitants. With examples like this in mind, writers, editors and educators have striven to portray Latin America and Latin Americans in a light that makes them justice. Readers have struggled for representational justice internally too. In 1996 two Costa Rican adolescents filed a complaint against the practice of reading in schools Joaquín Gutiérrez Manguel's children's classic about a black girl, *Cocorí* (Gutiérrez, 1947), a text translated to a myriad of languages. In 2005 a group of African-American opinion leaders officially decried the racist stereotypical visual rendition of *Memín Pinguín*, (Vargas Dulché, 1943) a black child character in a serial comic book. In both cases the polemic is still open.

The appearance and reception of Ruben Darío's *Prosas profanas* (1896) marked the coming of age of Hispanic American literature and gave authors of the region an equal footing with their European peers. Written for a girl who would later give birth to the Nicaraguan dictator Anastasio Somoza, Darío's *Margarita* is a beloved story in verse for children. *Realismo mágico*, during the second half of the 20th century, brought a distinctive form of fantasy to world literature. Earlier in the 20th century, Monteiro Lobato offered Brazilian children the series *Sítio do picapão amarelo* (1921–1944), where they could explore life in a farmland and imaginary worlds.

Poetic prose and poetry, with strong roots in Native, Spanish and Portuguese literatures, gained momentum in the area by contact with the Bengali Renaissance (Tagore), Maeterlinck, English nursery and nonsense rhymes, as well as with the work of the poetic avant-gardes. Thus, little by little books for children could be poetic, fun and entertaining, although in them science had a higher hand than fairies, which fluttered mainly around English children's stories and were practically banned from children's books, especially schoolbooks, in countries where governments embraced a Positivistic ideology, such as Brazil and Mexico, although, decades later, also in Cuba (Andricáin and Rodríguez, 2016, 393). Marina Colasanti, in Brazil, has given fairy tales a contemporary, feminist and ludic twist (Colasanti, 2015); Uruguayan writer Edna Iturralde revisits the Brothers Grimm in *Los hermanos que cosechaban cuentos de hadas* (Iturralde and Icaza, 2016) (Fig. 8).

It is not easy to gauge the recent production of books for children and adolescents in the region, nor to assess its quality, or even to have a reliable, comprehensive historical view of its development. Please see historical and critical works in "Brief selection of other relevant Children's Literature Studies" in References.

The longest standing seminar on children's literature is the *Cátedra de Literatura Infantil*, inaugurated in 1917 by Joaquín García Monge, editor of the journal *Repertorio Americano*, at the Teacher's University of Costa Rica, a double endeavor that steadily nourished the development of children's literature in the region.

Academies for the study and promotion of children's literature have later sprung up in Latin America. After founding the Uruguayan Academy of Children's Literature in that country, Sylvia Puentes de Oyénard established, in 2002, in Perú, the Latin American Academy of Children's and Youth's Literature, inviting scholars, teachers and librarians to set up an equivalent in each of their countries (Pizarro et al., 2020, p. 5).

Increasingly universities have become interested in children's literature as subject of teaching, research and dissertation topics. There are few regional scholarly periodical publications, among them, the award winning *LIIlbero* (see Fig. 9). For teachers,

Fig. 8 José Joaquín de Arriaga. *La ciencia recreativa*. Publicación dedicada a los niños y a las clases trabajadoras. Mexico, Tip. de J. M. Aguilar Ortiz, 1873. Lithography by Iriarte.

researchers and *mediadores*, IBBY produces *Revista Latinoamericana de Literatura Infantil y Juvenil* and Norma Publishing House, *Barataria*. The most recent magazine is IBBY—Latinoamerica's *Voces y tintas*, published in Spanish and English, which started in April 2021 with a regional scope and relative autonomy from publishing houses that are welcome.

Not all of studies or compendia are originated in or funded by universities. The role of national institutions geared to increase reading or non-governmental organizations and commercial publishing houses has been crucial in analyzing and disseminating information about Latin American children's books, authors and illustrators, as well as in fomenting the rise of new voices and texts through contests and publishing ventures. They have propelled the production of catalogs, yearbooks and reference books, reading guides, teaching materials and contests which have been helpful in fomenting children's literature and spreading knowledge about it in the area.

Discussion: the concept of Latin America in relation to children's literature

Placing a set of authors and works under the umbrella of "Latin American children's literature" has consequences that pertain to the chronology, the languages and the corpora that are to be studied, at the time it determines the choice of cultural elements to analyze this production.

Latin America's social configuration and literary heritage

Simon Bolívar dreamed of "*una patria grande*" (an all-encompassing homeland). "Latin America" is a term coined to proclaim the cultural unity of a vast geographical region. The term first mentioned appeared in 1836 (Ardao, 2000, p. 157) and was originally used in political, not geographical writings, to group and refer to "Latin" as opposed to "Anglo-Saxon" cultures in the American Continent.

This loosely defined concept—especially in the works of Uruguayan José Enrique Rodó (1871–1917), read with interest and fervor by youths of Spanish speaking "Latin America" during the first two decades of the 20th century—divided the population of the American Continent into two clusters and emphasized the clash of ideologies of the peoples of the "North" and those of the "South" due to their different languages and cultural traditions as well as their opposed religions (Roman Catholicism in Latin America and the Protestant Church among the Anglo-Saxon population of North America). Thus defined, the term provided an

Fig. 9 *LIJ-Ibero. Revista de Literatura Infantil y Juvenil Contemporánea*. Recipient of the *Hormiguita viajera* National and Latin American Award for Children's Literature in 2017.

ideological basis for French and Spanish interests in the region in an era of expansion of the United States and its Monroe Doctrine. In children's books, this is the time of North American companies such as Appleton and others which extended to Latin America.

Canada and Haiti, in spite of their French speaking populations, were not part of this first definition of "Latin America"; neither was Brazil, until 1889, after this country became a democracy and slavery was abolished.

In spite of its lack of precision and notwithstanding the fact that it does not take into consideration neither Native nor African ascendancy in the cultural definition of the area, the term "Latin America" served as a call for union among the thinkers and nations that embraced it.

The term emphasizes a legacy that is fruit of colonization, and does not take into account that as both its premise and aftermath the aboriginal population of the region was dispossessed and reduced to serfdom in order for European settlers to have a work force to build and give maintenance to roads, homes, hospitals and churches and at the same time organize the production of haciendas, plantations and mines. The cultural resistance of the local population decimated by disease, famine and work took the form of rebellion, frugal life, stoic endurance and persistence of vernacular languages, while poverty was exulted by early Franciscan friars and seen as natural in colonial society.

Dignity in poverty, as well as persistence in the use of mother tongues became part of peasant culture and rural children's lore as much as the oral literature that has survived and adapted to changing circumstances. Salient among what has been transmitted of this literature to our day are tales relative to Creation and the place of Humankind in the Universe; myths, fables, rituals, legends, riddles, poetry, mock battles and dances, which have specific genres as are Quechuan *wawaki*, lyrical dialogs and *urpi*, short poems (Hiflin, 1991, pp. 37–38).

Content of this lore has been transmitted in different ways. For example, the cosmogony and saga of the Quiché, *Popol Vuh*, written in colonial times by aboriginal authors, has been source for children's literature in adapted renditions, as that of Ermilo Abreu Gómez. In an indirect form of inspiration, an Inca knot system for communicating, *quipus*, and ancient tales were the basis for the *Cuentos peruanos* of María Wiese and Carlota Carvallo's tales for children, which honed into the ancient tales in *Rutsí* and *El pájaro niño* (Hiflin, 1991, p. 207). The figure of the traditional storyteller, *Amauta* among Andean cultures, often an aged person, persists in both oral and written traditions, as is the "*chasqui*," messenger who carried news in the Inca trail, name taken by a Bolivian magazine for children (Peña Muñoz, 2009, p. 531). Although probably altered in the early process of transmission from Indian languages to Spanish, there is record of early riddles, sermons and myths that extoll the role of virtue in childhood and youth, as *huehuetlatolli* in Nahuatl and *haravicu* in Quechua, as well as texts in non-alphabetic forms of representation that remind the beholder of the moral obligation to make the world a better place for all (Bonifaz Nuño, 1987, pp. 41–55).

In spite of long-standing acculturation processes, this endogenous or vernacular literature presents a set of narrative codes and value systems that differ in important ways from the Western Judeo-Christian and Greco-Latin canons, in this last case most notably in what pertains to community life and the relationship with nature. Specific genres have been identified, as the Pemon "*ekaré*," which designates a rumor or news of a true or testimonial historical fact, and "*pantón*," associated to fictional narrative (Peña Muñoz, 2009, p. 410). Contemporary renditions of this heritage are Ana Castillo's *Mi hija, mi hijo. El Águila. La Paloma: Un canto azteca/My Daughter, My son, The Eagle, the Dove: An Aztec Chant* (2000) and *Cuentos de los abuelos* (Bonifaz Nuño and Pizarro, 1999). Nevertheless, it is not the case that all countries publish children's literature in indigenous languages. In Ecuador, for example, in 2014 children's literature was not written in any of the national languages other than Spanish, in spite of a long tradition of ethnographic work with oral literature and local legends (Franco, 2014, pp. 235–236).

African legacy

Slavery was widespread and profitable in both Spanish and Portuguese dominions. Islands of the Caribbean and Brazil were important transit and end points of the slave trade that established international networks since early times—in the region from the early 16th to well into the end of the 19th century—as a means to have increased access to labor. With the work of the enslaved population, the area became highly productive. At the same time, the languages and traditions of different African peoples became part of the culture of the New World, and thus enriched the corpus of lullabies, songs, poetry, stories and fables for children with tales of wonder, narratives of suffering and resistance, an attitude of joy of living despite extreme hardship, and a form of spirituality that is different from Roman Catholicism, all underscored by the plight of slavery and the ensuing attitudes of rebellion and fight for freedom.

In the stream of high culture, there have been notable artists and intellectuals who have delved into the African heritage of Latin America, among them children literature authors as José Bento Monteiro Lobato, Mario de Andrade and Rogério Andrade Barbosa. Among contemporary works, examples of narratives about peoples of African cultural ascents are *Paquelé* (Llanes, 2006), which explores the life of a slave in colonial Cuba and *Y su corazón escapó para convertirse en pájaro* (Iturralde, 2001).

Alternative terms to name the region, and their consequences for children's literature

To refer centrally to aboriginal cultures in the region's identity José Carlos Mariátegui proposed the term "Indoamérica," taking as root the word "Indian," as the aboriginal population was called since colonial times. The *indigenista* discourse of Peruvians Mariátegui and José María Arguedas vindicated the rights and cultural values of the indigenous population and its cultural heritage as distinctive of the nation and the region.

Mariátegui's avant-garde magazine *Amauta*, first published in 1926, inspired essays on children's literature and children's stories rooted in vernacular traditions, respectively, by writers María Wiese and Carlota Carvallo—one of Peru's 20th century pioneer

children's writers, together with Francisco Izquierdo Ríos. Writers and illustrators found a wealth of prime materials to work with by latching onto the Arts and crafts movement that proposed research in folklore and Native traditions to find new, authentic venues for national creation, as did Elena Izcué. Later, in Bolivia, Rosalba Guzmán and Gaby Vallejo, salient in a group of talented writers and educators, created several initiatives and children's magazines that gave children access to Bolivian contents and cultural forms that were conceived as especially relevant and situated (Peña Muñoz, 2009, pp. 530–542). Atavistically attached to their land, it was hard to integrate Indians to industrial society and the proletariat. In what has become a classic of children's literature, *Pablo Yunque*, Peruvian César Vallejo portrays the hardships of poor urban children of Indian ancestry in societal tensions of race and class (Vallejo, 1981).

How many “roots”?

Twentieth century developments of the idea of Latin America gave way to that of a “double root”: Indian and European. The African heritage was rarely identified or acknowledged inasmuch the myth of the “double root” was entrenched. We can see this in the field of children's literature by examining the contents of *Lecturas clásicas para niños* (1924), a project of Latinamericanist José Vasconcelos that consisted in adapting a set of canonical classical works from different Eastern, Western and local traditions, in which those of African origin were not included.

In the 21st century, African ancestry has been claimed or conceived of as a “third root,” together with Native and European heritages. The foundational role gradually acknowledged to Native and African cultures, however, has not translated into equal access to human rights and economic prosperity for the Indian or Afrodescendant populations. These groups are nowadays equal in rights to people from European or mixed ascendancy, but are disproportionately afflicted by unequal access to well remunerated work or to full social, health and educational services; they are especially vulnerable to forms of violence, racism, classism and sexism that undermine their rightful exercise of human rights (Bello and Rangel, 2002, pp. 39–54).

In 2010, 63% of all children in the region were affected by poverty in some way, while the situation was even more critical among indigenous children, 88% of whom were affected, and three times more indigenous children living in extreme poverty suffer severe privation in access to education, safe drinking water and housing than other children (ECLAC and UNICEF, 2012, 4–6). Inequality in the area has increased in the last decade, and was worsened by the Covid-19 pandemic (ECLAC, 2016; ECLAC and UNOCHR 2020). The region's population, including children, is afflicted by what has been called “accumulative disadvantages,” related to gender, age, ethnicity, health and place of residence (UNESCO, 2020).

Nevertheless, the place of Indigenous and African cultures in Latin America is decisive and widespread.

An estimated 41.8 million indigenous people lived in Latin America in 2010 (World Bank, 2015, 25). Currently 420 languages are spoken and 99 language families can be discerned in Latin America, according to the *Atlas sociolingüístico de Pueblos Indígenas de America Latina*. Currently the Amazon is the region with the largest diversity of indigenous peoples (316 groups), followed by Mesoamerica, the Orinoco basin, the Andes and the Chaco region (World Bank, 2015, 24). The distribution of Indian languages does not coincide with current national boundaries. According to the mentioned Sociolinguistic Atlas of Latin America, one-fourth of all Indian languages are spoken in two or more countries, and Quichua extends to seven countries (Sichra, 2009, ix). The area is inhabited by 665 peoples with a total of 29, 464, 00 persons (Sichra, 2009, 65). Almost a fifth of these individuals have stopped speaking a native language.

There are national and local initiatives to respond to the reduction of speakers and vernacular languages: old and new texts are published so that children can practice their mother tongue or that of their elders. Bilingual editions are growingly available due to national legislation and educational programs that foster the cultural revival or strengthening of communities where native languages are or were spoken. In several countries native languages are recognized as national languages and there is a thrust to integrate Indian languages, knowledge and values, contemporarily understood as “native epistemologies,” into the general curriculum. Forerunner countries of these policies are Peru, Bolivia, Mexico and Ecuador.

Thus, Latin American children's literature in the 21st century is in part geared to fostering the national knowledge of aboriginal cultures by drawing mainly on myths, folktales, fables, riddles and depictions of life in rural areas, mainly in Spanish or Portuguese, but increasingly also in Indian language editions. Several national, regional and international institutions and publishing houses have devoted books or series to children. Nevertheless, it is not a practice that is sufficiently extended. In decolonizing critique, this move to appropriate indigenous lore has been seen as an attempt to make the settler indigenous to the land he occupies (Tuck and Yang, 2012, pp. 1–40).

In a different line of inquiry, one can find that though needed and welcome, children's books for indigenous population in vernacular languages are disproportionately centered on traditional folklore, generally omitting both new writers and different topics in the humanities, sciences, technology or current social issues, with scarce use of either endogenous or innovative literary forms, all of which would contribute to the expansion of horizons that is one of the expected outcomes of reading literature. Some initiatives are geared to compiling and publishing texts written by children, for example *Relatos y andanzas. Historias de niños y niñas de los pueblos originarios de Chile* (Cuevas Parra, 2002) or the games they play, as in CONAFE's *Así cuentan y juegan en la Huasteca* (CONAFE, 1982). In any case, as it is stated in an intergovernmental-sponsored document, “the poverty of indigenous children cannot be understood without considering the systematic impoverishment to which their peoples have been subjected” (del Popolo, 2012 p. 6). Literature can contribute to this understanding.

In what pertains to African cultures in Latin America, according to UNESCO, the estimated number of people enslaved in Africa and taken to America between 1500 and 1867 is 12.5 million. The descendants of this African diaspora are called “Afrodescendants”

in Latin America since 2001—after the Durban World Conference against Racism, Racial Discrimination, Xenophobia and Related Intolerance. In 2015 Afrodescendent population of the region amounted to 130 million people, that is, 21.5% of the total. In terms of absolute numbers, Brazil has the largest Afrodescendent population. In the year 2000, 45% Brazilians identified themselves as Black or Mulatto (Abramo and Rangel, 2019). Nevertheless, the role of African population in the national construction of identity has only recently been acknowledged in national laws and policies of the region.

In children's literature, "Black" and "slave" were, until very recently, treated as synonyms, which reinforced racist attitudes in young minds. In spite of much earlier abolition of slavery in other countries of Latin America, in Brazil it was legal until 1880; 1886 in Cuba. This tardiness explains and reinforces structural racism against Afrodescendent people in these countries and in the region, where during the 21st century African ancestry has been claimed or conceived of as a "third root," together with Indian and European heritage, as was stated above. This should mean making available books and visual narratives for children that portray African heritage and Afrodescendent experience in Latin America in an accurate, dignified and appealing manner, by exploring either the cultures and languages of Africa or their development in America.

In literature, although early authors of *negrista* poetry imitated, recreated or invented African rhythms and words, at the same time they made reference to drums and other percussion instruments, as did Juana Inés de la Cruz in New Spain, it was not until well into the 20th century that authors of African ascent like Nicolás Guillén and Emilio Balagas, in Cuba, wrote of African heritage from their own experience, or produced criticism that decried social exploitation that went beyond the attitude of commiseration of most of 19th century production. Avant-garde authors, among them Porto Rican Luis Palé Malós, experimented in poetry with African heritage rhythms. Trained anthropologists directed their inquiries to the African legacy to local folklore, language and spirituality. In Costa Rica, the Africanized adaptation of an Andalusian tale: "Ratón Pérez y la Cucarachita Mandinga" appears in *Cuentos de mi Tía Panchita* (Lyra, 1984; Cuesta de Vélez, 2013, 365); in Colombia, classic children's writer Rafael Pombo imitated words of African root when he named the protagonist of the fable "Mirringa Mirronga. La Gata Candonga"; *Silver people: Voices from the Panama Canal* (Engle, 2014) commemorates for young readers the "darker skinned" people who worked on the site more than 100 years ago.

In Brazil, Romantic writer Antonio Frederico de Castro Alves penned the poem *O navio negreiro* (Castro Alves, 1880) and the novel *Os escravos* (Castro Alves, 1883) while Modernist José Lins do Rego gave life to *Menino de engenho* (Lins do Rego, 1932). Aimé Césaire's *Discours sur le colonialisme* and the African movement of *Négritude* had resonance in Latin American culture (Clouthard, 31). Contemporarily, André Diniz's *Morro de favela* (Diniz, 2011) portrays, with the aid of color photography, the different lives of Blacks and Whites. Heloisa Pires Lima, Liz Zatz, Julio Emilio Braz and Rogerio Andrade Barbosa are writers who work on the line of dignified representation (Meléndez Moré, 2019, 13).

Nevertheless, Latin American authors, educators and publishers still have to find ways to responsibly, effectively and persuasively work literarily with multiracial, multicultural and multilingual individual and collective identities. There is currently a commitment to portray Indian communities and Afrodescendants in a way that is accurate and fair at the time it accounts for the diversity of historical and actual experiences and contributions of these populations to the culture and welfare of Latin American societies, although miserabilistic or folkloric approaches are not always avoided.

Other denominations of the area, and their consequences for children's literature

Other denominations of the region we have so far called "Latin America" have different political and practical implications. José Martí kept the basic distinction drawn by Rodó when he used the term "*Nuestra América*" (*our America*). Martí's conception can be clearly seen in his children's periodical *La Edad de Oro* (1889), where he admonishes readers to learn what is *theirs* and read *their* classics, as much as he calls on their parents to drink local wine, even if it is made of bananas. In his conception, pre-Hispanic cultures together with the fight for freedom and independence define the region, so children's literature must first provide that basis to later on open up to the world.

Right after the independence of Cuba from Spain, in lieu of "Latin America," James G. Blaine proposed the term "Pan America," which comprises North and South of the Continent, a logical extension of the notion of "America for Americans" of the Monroe Doctrine (Ardao, 2000, p. 159). American and International publishing houses produced series of stories about the Continent for children, among them both W. Jackson and Herder. The Pan American Bureau in 1945 put forth a "Series for Young Readers" as well as the compilation *Children's Books on Latin America* and *Materials in English on Latin American Literature*. In the same vein, the Biblioteca Billiken produced the "Blue collection," in which biographies of notable men and women of all the Continent were presented to children, a series which ran at least from 1939 to 1968, with five editions (Varela, 1994).

In view of the loss of its colonies in America, Spain and Portugal advanced the idea of "Hispanic America," or "Iberoamérica" on which "Hispanic" referred to the Hispanic Peninsula to encompass both Spain and Portugal, and their interests in the region. Contemporarily Spanish and Portuguese publishing companies—endorsing this conception—have activity in several countries of the region. This has consequences for the relationships among authors, publishing house and readers, because it induces metropolitan-style dominance in the distribution and ranking of works, as well as in its marketing strategies, which consist in the recognizable homogeneity among all products (Barrera Anderle, 2002). This apparently runs counter to what in our day has been hailed in the region as "Bibliodiversity," at least in one of its possible interpretations (XXVI Cumbre Iberoamericana, 2018, 15–16).

During the 20th century political and economic agreements and institutions redefined the scope of the term "Latin America." ECLAC grouped "Latin America" and "the Caribbean"—which already included former Spanish dominions in the Caribbean—to

include Antigua and Barbuda, Bahamas, Barbados, Belice, Guyana, Haití, Jamaica, Saint Lucia, Trinidad and Tobago, Suriname. Due to political considerations, the Organization of American States includes all the countries of the American Continent except Cuba.

The Regional Office of UNESCO for Latin America and the Caribbean, through CERLALC (Regional Center for the Support of Book Publishing) groups Latin American book production with that of Spain and Portugal, which includes titles in three Spanish national languages: Catalan, Gallegan and Basque (González Mendoza, 2021; González Mendoza and Wisenbart, 2019). By the same token, books in Spanish and Portuguese are written today and published in the United States of America, also produced to be exported to Latin American countries.

Conclusions

Children's literature in Latin America is today a growing industry and a social endeavor that is still woven into the goal of contributing to ensure that every child has the opportunity to reach adequate levels of reading skills and is thus prepared to exert his or her right to education, so it has been difficult to completely shake off didactic means and goals in favor of literary exploration of forms and values which are formative in their own way.

The study of the literature for children of the region depends on how it is defined, by whom and with what purpose. Within the region, it has been used mainly to convince children to embrace certain values and attitudes; from outside, Latin American children's literature has mainly served as a means to understand and sometimes either buttress or distort or redefine the identity of individuals and communities that are related in some way to those lands, and not only as a means of artistic communication with young readers. Taking into account that identity is dynamic, and that literature is the art of words and form, Latin American children's literature can be approached in more nuanced and diversified ways than those that in large measure have been used up to now. Authors, editors, illustrators and editors can continue to strive for what Alicia Borinsky has described as "invoking a region beyond literature through literature" (Borinsky, 1993 ix-x) and purport to speak to children of all that which authors, illustrators, parents, teachers, institutions or governments find valuable, noteworthy or worrying in the history, actual life or future of their country, their region or the world, Humankind and the Universe, through the means of art, making resource to local and universal genres, topics and styles in a way children and youths feel respectfully addressed, creatively engaged, esthetically moved, enlightened and free to examine and judge for themselves.

Great strength would be gained from easy access to both the historical and the new production of different countries, of which so far most circulates mainly within its own borders. The historical archive is practically inaccessible, despite serious efforts of national libraries and other institutions geared to providing bibliographic services. In general terms, a more equitable access to education and culture, and a fairer distribution of income would, undoubtedly, make life and literature better in the area. Offering more opportunities for all children and youths to exert their rights to read and write, to listen to and to tell stories, in individual, collective and inter-generational processes, in all the languages and traditions of the region, in conversations with literatures and languages of the world, would bolster and fairly distribute among the population skills for discernment, appropriation, mastery, enjoyment and creativity. This can only strengthen every person's capacity to create and enjoy children's literature, and to share it with the world.

May Fourth Movement The May Fourth Movement of 1919 was a nationalist mass movement, considered as the beginning of Contemporary history, including in the field of literature. During the May Fourth era (1915–1925), Chinese intellectuals waged the New Culture Movement, questioning the relevance and validity of the Confucian tradition while searching for new ideas from abroad. Marxism and Communism—together with liberalism, anarchism, pragmatism, Bergsonism, etc.—entered China. Given its multifarious and multileveled significance, the May Fourth Movement sparked interest among scholars of different politico-cultural backgrounds, almost immediately from its occurrence into the early 21st century

Feng Zikai Chinese Children Picture Book Award is the first international Chinese children's picture book award. The award aims to honor writers and illustrators for their creation of distinctive Chinese children's picture books, to encourage publishers to publish original Chinese children's picture books, and to engage the public in valuing and reading original Chinese children's books

"Literature is a vehicle for conveying truth" (Wen-yi-zai-dao) This is the key of understanding Chinese literature and children's literature. This sentence was summarized by Zhou Dunyi (1017–1073), a philosopher of Song Dynasty: It means the text of a book, story or a poem is like a car that carries goods to their destination. Therefore, texts must serve to carry the doctrine; the ancient Chinese literary tradition emphasizes this focus on reality

Young Pioneers The Chinese Young Pioneers (referred to as "Young Pioneers") is an organization for Chinese children. It is an organization for children to learn about communism. All children whose age are 7 or 8 should join in the organization. The Communist Party of China entrusts the Communist Youth League of China (as CYLC) to directly lead the Chinese Young Pioneers. The Chinese Young Pioneers hold the Young Pioneers Congress (referred to as the "Youth Congress") every year, and elect new leaders of the large, medium and small teams. The slogan of the Young Pioneers is: honesty, bravery, liveliness and unity

Introduction

In the view of most Chinese scholars (e.g., Huang, 2021; Wang, 2009), children's literature in China emphasizes understanding through literary works, such as novels, prose and other works created, adapted, translated and published by adults for children's development. Literature plays the role of promoting children's spiritual life and esthetic development, shaping their ideology according to moral education, and transmitting knowledge. This perspective suggests that children's literature should be a multi-coexisting subject system that includes not only creating literature in a variety of styles and genres, but also draws on literary means to transform all kinds of knowledge, connecting children to vivid representations of the world that foster both understanding and feeling.

Discovering the children: children's literature at beginning of 20th century

There are ongoing debates about the origins of Chinese children's literature. Most researchers think that the birth of Chinese children's literature is best viewed against the background of China's modernization, which aimed to facilitate social progress by

importing Western technology, knowledge and culture. Elite intellectuals made great efforts to borrow from Western culture and literature so as to enlighten the Chinese public, with a special focus on children (Chen, 2013).

When did children's literature begin in ancient China? While there is no consensus, there are several, and some controversial, arguments about the origin of literature for children. Some researchers in the field of children's literature believe that Chinese children's literature originated in ancient China; for instance Wang (1999) points out that the collection *Searching for God [Sou Shenji]*, which was written in the 4th century by the historiographer Gan Bao, includes a chapter that was deemed "the most laudable and famous fairy tale" (Wang, 1999). However, the relatively limited view of children and childhood in Ancient China stifled the development of children's independent position in society, and the shortcomings of early schooling restricted the appearance of children's literature. Therefore, the role and status of children's literature in educational history had not been highlighted (Zhu, 1998). Children's literature had not yet become a kind of conscious literary category, and the related production of literature, development of theoretical criticism and the writing of literary history had not been established. This was the status quo without a substantial breakthrough until the beginning of 20 century. As Mao Dun (1896–1981), the famous modern Chinese writer, noted: "The terminology of children's literature began to be used only since 1919" (Mao, 1993:147). With the "discovery" of "children" during the turn of the 19th and 20th centuries, literary works specially created for children came into being; Chinese children literature was born from this moment.

In terms of the characteristics of children's literature in China, as contemporary educator Gu (2018) argues, Chinese traditional culture has to be scrutinized with an understanding of the way Confucianism provided the ideological foundation and value orientation, although Chinese traditional culture includes not only Confucianism, but also Taoism, Legalism, Mohism, etc. Under the influence of the Chinese cultural spirit and the psychological structure of national culture, Chinese children's literature has an important tradition – it represented the view that literature is the carrier of morality and ideology ("Wen-yi-zai-dao"). Therefore, literature with conveying morality (Zhou, Dunyi, The Confucian of Song Dynasty, 11 century) has deeply impacted children's readings, emphasizing that all kinds of text must serve as the carriers of doctrine since ancient China. Hence, the ancient Chinese literary tradition has also deeply impacted contemporary Chinese children literature, and naturally has had a profound influence on modern literature, and on the creation of Chinese children's literature in the 20th century (Wang, 2009). Modern Chinese children's literature writers seem to have an innate sense of mission, social responsibility, and a sense of "using the pen as the banner" as quoted by poet Ai, Qing, 1910–1996 (Ai, date, page) to serve the nation.

The birth of the category of Chinese children's literature is best viewed against the background of China's modernization, which aimed to facilitate social progress by importing Western technology, knowledge and culture. Elite intellectuals made great efforts to borrow from Western culture and literature so as to enlighten the Chinese public, with a special focus on children. Influenced by the literature of Japan and modern European literature, children in China had been begun to be recognized by writers and society at large (Wu, 2011, 2012). At the same time, Chinese children's literature began to look very different from the long historical period that came before. In this initial development of Chinese children literature, new literary qualities of modernity gradually emerged, which are intricately intertwined with a new cultural form. From the May Fourth Movement in 1919 to the present, Chinese children's literature has gone through a century of exploring its own way and it has demonstrated the ideological goal of cultivating its young people; that is, the 100 years of children's literature development has always been closely related to the destiny of the nation-state. The May Fourth Movement of 1919 not only opened up modern Chinese literature, but also the cradle of Chinese children's literature. As noted above, these beginnings of Chinese children's literature began with the discovery of "children"—those who had previously been considered "little adults".

As Wang (2016), one of the contemporary scholars in the field of children's literature argues, unlike western children's literature that takes fantasy as the basic foundation, Chinese children's literature has a distinct overall characteristic that runs through it since its birth; that is, the connection between children's literature and reality. In this sense, the history of Chinese children's literature is a history of realistic literature (Wang, 2016). This kind of literature is manifested in the description, reflection, judgment and imagination of reality, in the pursuit of realistic and vivid artistic effects, and by a focus on the cognitive and enlightening functions of literature. Moreover, as Wang points out, in a sense the development history of a children's literature is the evolution of the history of adults' view of children. In this way, children's literature texts, influenced by a particular view of childhood, will invariably include cultural assumptions that reflect the characteristics of the larger culture. In the 1980s, academic circles in China reached a consensus that children, or cultural assumptions about childhood, should be the basis for the study of children's literature; for example, Zhu (1998) argues that "the view of children should be the origin of children's literature" (p. 98). Similarly, Fang emphasizes childhood as the logical starting point of children's literature theory (Fang, 1993), and Wang argues that understanding of children is at the base of the esthetic origins of children's literature (Wang, 1999). Chinese children's literature, then, hews close to reality, with representative works rooted in the Chinese social and cultural context.

It was not until the 1920s that the Chinese people's emphasis on children's literature underwent a fundamental change and transformation. There are two very important articles, namely *How We Be Fathers Now* written by the famous writer Lu (1919) and *Children's Literature* written by Zhou Zuoren (1885–1967) in 1920. The publication of *Children's Literature* (Zhou, 1920) is undoubtedly a landmark, which first proposed the concept of "children's literature" in Chinese literature history. Since then, the attention to children's literature had been gradually expanded, and the amount of work identified as "children's literature" has become more culturally visible. Wei Shouyong and Zhou Houyu first proposed that children need their own literature in their work, *Introduction to Children's Literature* (Wei and Zhou, 1923). Influenced by John Dewey's child-centrism, they convened a group of teachers and created a large number of children's literature education books for young children and primary school students. Meanwhile, *Children's Literature Studies* (Zhu, 1924), *ABC of Children's Literature* (1929), *Literature on Children's Literature* (Zhou,

1932), *Researches on Children's Stories* (Chen, 1932), and other works on the definition, classification, positioning, and teaching methods of children's literature research and thinking provided preliminary theoretical bases for the construction of the history of Chinese children's literature at the beginning of the 20th century.

Along with theoretical explorations, representative works illustrate the vibrant creativity in the field of children's literature. *Scarecrow* by Ye Shengtao (1894–1988), published by the Commercial Press in 1923, was the first collection of short Chinese children fairy tales in China. The scarecrow in the story sees the grains of the old peasant women's labor being devoured by locusts, the fishermen's children freezing and starving on the boat, and the lower-class women who had the miserable fate of throwing herself into the river to commit suicide. All this was seen and heard by the Scarecrow, but he could neither shout nor run to save their lives. The only thing he could do was to wave his broken fan, which required the external force of the wind to move. This children's fairy tale deeply reflects the anxiety and pain in the Scarecrow's inner heart. He saw and heard these miseries, but the scarecrow couldn't do anything. The final outcome could only be one of helplessness and painfulness and to fall down to the ground. Scarecrow is a symbolic children's fairy tale character, who was regarded as providing a model for the creation of Chinese fairy tales, which reflected the unique realism in children's literature.

After Ye published his work, the second representative writer of Chinese original fairy tales was Zhang Tianyi (1906–1985). Zhang inherited and carried forward Ye Shengtao's original tradition of children's literature, pushing the spirit of realism to a new height. He directly writes about social changes, especially realistic social relations and struggles, in his works. Zhang Tianyi created two genial characters, Dalin and Xiaolin (Zhang, 1934). *Da Lin and Xiao Lin* tells the story of Da Lin and Xiao Lin's fantastical experiences to reveal the reality of life under social conflict. This long children's story, published in 1932, reflects Zhang Tianyi's view of children's literature as a depiction of the real world; Da Lin and Xiao Lin were fictional characters, but they have a deep basis in reality. The work takes the different fates of the two brothers as a clue, and through their experiences, they link the life of the upper and lower social strata and the contradictions and struggles of the two classes, conveying a sharp social criticism. Zhang Tianyi adds many fantasy elements and absurd plots, such as monsters that can turn child laborers into eggs and eat them, which makes the cartoonish depiction more interesting to children and fully demonstrates the author's fairy tale approach. It is a classic among the Chinese children fairy tales, and became the most popular fairy tale in the period of 1930s and 1940s. From the point of view of artistic innovation, his works with their exaggerated characters and witty language indicated that the era of Chinese fairy tales had begun to mature.

The best-selling collection of children's literature around this time is Bing Xin's (primitive name Xie Wanying, 1900–1999) *To Little Readers* (Bing, 1941) which is a collection of her letters written from 1923 to 1926. This book was published in a single volume from 1926 to 1941, and it has been reprinted 36 times. Besides this, the other most influential children's publication in this period was *Children's World*, which was founded and edited by Zheng Zhenduo in January 1922 and published by the Commercial Press. Bing Xin and Zheng Zhenduo created stories which idolized and eulogized the child—narratives in which the child may even have the power to save the (despairing) man. The pure child also took its place within the discovery of formerly marginalized figures. The child figure retained both an abstract quality and an allegiance to society's victims; an often mute, pathetic companion to the adult whose suffering was the narrative's primary concern.

The choice of realism in Chinese children's literature is not accidental, but an inevitable choice of the norms of the times and the evolution of Chinese society. From the very beginning, modern Chinese children's literature has been confronted with a very serious problem; that is, 20th century China was a disaster-ridden country.

It is in such a social background and cultural context that the Chinese modern children's literature was generated. "Enlightenment, national salvation, revolution, and war" are the panoramic perspective and key words for observing the century-old modern Chinese society.

Politicalization of children's images: children's literature between 1950s and 1970s

After the founding of Peoples' Republic of China, Chinese society entered into the collective action of building a new China. In the peaceful period of the 1950s and 1960s, the creation of children's literature might have turned to fantasy, poetic, and romantic literature. However, Chinese children's literature in the 1950s and 1960s was still dominated by realism with adults' interests and will as the interests and will of the children. Children's literature at that time mainly reflected realistic political issues and social expectations, which were related to the understanding of childhood at that time. This includes a certain pragmatism or even utilitarianism in the way literature was viewed at that time, which naturally also affected children's literature. Pragmatism, utilitarianism and children's literature are closely related. Under these circumstances, children were considered to be the successors of the new Communist Party, and children's literature writers and originators were obliged to cultivate these successors. For instance, during this period, the "red classics" of children's literature were produced. The representative works of children's literature were *The Little Hero Yulai* (Guan, 1955), *The Sparkling Red Star* (Li, 1972) and *Little Soldier Zhang Ga* (Xu, 1968). The children portrayed in these works were witty and brave, participated in the struggle of the turbulent times of war, and reflected the living conditions of children in the war years.

At the same time, the creation of children's literature in the 1950s and 1960s was linked to the work of the Young Pioneers, a youth organization for children run by the Communist Youth League founded in 1949. Children's literature authors cooperated with the tasks of the Young Pioneers and expressed the life of children in the organization. There were also a number of excellent children's literature works in the literature of the Young Pioneers. For instance, the novel *The Story of Luo Wenying* (Zhang, 1955), written by Zhang Tianyi in the 1950s, featured images of soldiers and counselors of the Young Pioneers. Meanwhile, many poems

mainly expressed the life of the Young Pioneers, such as "Annoyance of the little Captain" (Jin, 1955). In this way children's literature had become a tool to serve the Young Pioneers during 1950s–1970s.

It was under this pressure of the political context that researchers of children's literature published their works. Examples include Chen Bochui's work, *A Brief Discussion of Children's Literature* (Chen, 1957), Fang Jisheng's study, *Trial Discussion on Children's Literature* (Fang, 1957), Jiang Feng's *Speech on Chinese Children's Literature* (Jiang, 1960), He Yi's *Essays on Children's Literature* (He, 1960) and Lu Bing's work, *Literature for Educating Children* (Lu, 1962). These theoretical works continually examined the questions: What is children's literature?, How should children's literature be categorized?, and How should we teach children's literature?, among other issues, all infused with a strong sense of social responsibility.

In the 1950s and 1960, although Chinese children's literature was endowed with new characters and requirements on shaping children's images which served political purposes, it was still moving forward, forming a flourishing period. At this time, the creation of children's science fiction literature entered a short-lived but productive period. Influenced by science fiction literature of the Soviet Union, science fiction and science literature were regarded as a means to popularize scientific knowledge to children in China. Examples are the well-known *Little Swallow's Million Miles' Flight* (Qin, 1950), *Our Soil Mother* (Gao, 1955) and *Little Tadpole Looking for Mother* (Fang and Sheng, 1960). At the same time, there was increased interest in translation and the introduction of Soviet children's literature theory. In the first 20 years of the founding of the People's Republic of China, not including the Soviet children's literature papers scattered in various academic journals and periodicals, more than 25 types of children's literature studies were compiled and printed.

The other development in children's literature was its role in the reshaping of images of children in education. Some representative works of this time include, *Magic Pen Ma Liang* (Hong, 1956), *The Secret of the Treasure Gourd* (Zhang, 1956), and *The Harbor of Next Sailing* (Yang, 1958). *The Secret of the Treasure Gourd* tells the story of Wang Bao's fantasy that he has a treasure gourd and can obtain anything, but this treasure also brings him pain. So he throws away the treasure gourd and later finds out that it was a dream. He therefore corrected his shortcomings and studied hard. This work opens up a new way of writing fairy tales; it creates both the fantasy world and the real world, and satisfactorily solves the transition and connection between the two worlds. *The Harbor of Next Sailing* describes Tang Xiaoxi's peculiar experience in the port of "The Next Ship", which is cleverly conceived. The author uses the idea of time, seizing the "next time" excuse that children often use to waste time and creates a fairy tale world where there is no time and hour and, for children, it is a place "happier than happiness". But it's also a place where bad guys go about their ways. Yan Wenjing pays attention to fictional images from the perspective of children, and integrates game-like elements into the characters, so that the fairy tale image is suitable for children.

However, from the mid-1960s to the late 1970s, the huge political catastrophe of the so-called *Cultural Revolution* (1966–1976) resulted in all works in the field of children's literature and most writers and theorists being criticized, and the creation of children's literature ceased. Questions such as: what kind of characters should children's literature create?, what kind of children's personality should be cultivated?, what is the social function of children's literature?, should children's literature expose the dark side?, as well as whether children's literature should reflect the political struggle of the people, that been discussed earlier, were now overwhelmed by strong political criticism. Critics were not only unable to pose these exploratory questions, but were deprived of their right to defend themselves.

Back to childhood and recreation: children's literature since 1980s

After the end of the Cultural Revolution, children's literature magazines such as *Children's Literature* began to publish again. The creation of children's literature also became active after the reform and opening up of the country. With the deepening of ideological emancipation, the authors began to pay attention to the esthetic and entertainment value of fairy tales themselves, and penetrated into the inner world of children. They broke the shackles of the formulaic and conceptualization, and brought fairy tale creation into a new stage. At the beginning of the discussion, "child-centered" was still regarded as Deweyian theory, which had been vehemently criticized during 1950s–1970s. Due to the constraints and limitations resulting from closure of the state, there were no further in-depth studies in this progressive tradition. Since 1970s, some researchers have argued that the function of children's literature was to serve educational instruction, rather than just providing the literary works (Lu, 1979). A few years later, Cao Wenxuan proposed that *Children's literature is literature* (Cao, 2012), which represented the aspirations of many young writers and scholars to focus on children's literature. With time, more researchers and theorists also joined this way of thinking. The younger generation of writers who had experienced political turmoil now started to rethink the essentiality of children's literature. A group of young fairy tale writers emerged in the 1980s, holding high the esthetic banner of artistic innovation. These writers have become the backbone of fairy tale creation in the new era, and have exerted extensive influence on children. Representative works include Zhang Zhi's *Thunderbolt Beibei* (Zheng, 1986), Zheng Yuanjie's *Pipiru* and *Lu Xixi* (Zheng, 1989), Zhou Rui's *Second General*, Bing Bo's *Swing, Swing*, and Tang Sulan's *Stupid Wolf Story*. Most of these works respect children's personality development and focus on cultivating children's awareness of independent thinking, which is a great leap. The fairy tale works return to the nature of literature, and turn their attention to the family life and school that children are familiar with.

Hence, the 1980s opened the era of rewriting the history of children's literature. The children's literature history was now seen as worthy of recognition in the collection and arrangement of historical materials. Since then, the writing of the history of Chinese children's literature has gradually had a strong developmental trend. For instance, books such as *History of Contemporary Chinese Children's Literature* (Chen, 1989), and *Essays on Children's Literature* (Jiang, 1979) were published. Wang Quangen published his

work, *The Main Trend of Modern Chinese Children's Literature* (Wang, 2000). In the same year, Zhu Ziqiang's work, *Chinese Children's Literature and the Process of Modernization* (Zhu, 2000), triggered further discussions. In addition, Liu Xuyuan's, *A Brief History of Chinese Children's Literature 1916–1977* (Liu, 2013), and Fang Weiping's work *Four Decades of Chinese Children's Literature: A Historical Overview* (Fang, 2018) had a huge influence in the field of literature. From the conception of "children's literature" to the writing of the history of children's literature, scholars have re-focused on new problems and new phenomena in the developmental history of Chinese children's literature over the past century. The current studies have also included many achievements in the writing of children's literature history, the sorting out of children's literature trends and genres, and the elaboration of children's literature creation. As Fang argues, children's literature is a special form of literature; specifically, its uniqueness lies in the fact that it is mainly created by adults and the recipients are children. This constitutes the inherent contradictions and puzzles of children's literature: the cultural generation gap and the intergenerational conflicts can impede literary acceptance. Indeed, the key issue of children's literature is how children are viewed (Fang, 2018; see also Rose, 1984 for a similar argument in the West).

Since the reform and opening-up policy implemented during 1980s, along with the reflection and review of "childhood theory," the concept of "child-oriented" has taken a foothold in children's literature research. Chinese children's literature researchers began to explore children's literature theories with a holistic perspective to comprehensively understand children's literature. Recent studies reflect many new, deeply discussed themes, such as a Chinese-style children's literature theoretical framework, comparative children's literature, the study of fairy tale art space, the study of children's esthetic instruction, and the study of the narrative form of children's fiction. Moreover, there is a greater acceptance of children's literature as literature, and increased interest in the study of the motifs of children's literature (Zhang, 2006). These multi-faceted and multi-layered theoretical explorations have greatly expanded the theoretical space of Chinese children's literature. The continuous expansion of theoretical boundaries has also brought diversification of research methods. Particularly, recent researchers have borrowed from the fields of esthetics, anthropology, psychology, ethics and other disciplines to read and think about the works, embodying a strong esthetic and academic rationality (Wang, 2000; Liu, 2013). In general, the study of children's literature during this period has made considerable progress, and both the system and value of the discipline have strengthened and become more accepted. The theoretical research of Chinese children's literature realized the modernization of its research paradigm (Zhang, 2006).

Multiple perspectives on understanding Chinese children's literature

China is a vast country with abundant resources, and has nurtured a diverse and rich regional culture. Since the beginning of the 21st century, a vibrant area in academic research on children's literature has focused on regional culture and regional human factors, exploring the various aspects of the national characteristics of children's literature. From the perspective of regional culture, a series of children's literature histories with regional cultural characteristics have emerged. For example, *Re-discussions on Inner Mongolia Children's Literature* (Zhang, 2018) investigates children's literature in the inner Mongolia region. Another book, *Analysis of the Development of Anhui Children's Literature*, describes children's poems and poets in Anhui province (Liu, 2004). Other examples include Sun Hailang's study, *Review of Jiangxi Children's Literature in the New Era* (Sun, 2004), Zhang Zhongyi's research, *Observation of Henan Children's Literature* (Zhang, 1952), and Chen Zidian's book, *Introduction to Guangdong Contemporary Children's Literature* (Chen, 2005), that concentrate on Jiangxi, Henan and Guangdong area in the field of children's literature respectively. Clearly, the role of such regional children's literature history writing is to reconstruct the entire Chinese children's literature map with respect to regional perspectives.

Researchers of children's literature in China have also expanded their horizons to the field of children's literature created by ethnic minorities. Minority children's literature is a very important part of the treasure house of Chinese culture and oriental civilization. Ethnic children's literature embodies the ardent expectations and hopes of the elders of all ethnic groups for the new generation, while the traditional national virtues and the essence of national culture are naturally hidden deep within it. In the progress of history and the development of the times, national children's literature has become a unique accumulation and unique symbol of national culture. Zhang's research brings brushstrokes to the ways the villages and wastelands inhabited by ethnic minorities explore the unique spiritual representation and artistic form of ethnic minority children's literature (Zhang, 1952, 2018). In addition, Zawa's work, *Introduction to Tibetan Children's Literature* (Zawa, 2005) focuses on the "ethnicity" characteristics of Tibet minority children's literature, and organically integrates the psychological qualities of minority children and ethnic groups with the development trend of the times. As a whole, these studies enrich the nationality and folklore character of Chinese children's literature.

The tentacles of expansion of Chinese children's literature history have also extended to Hong Kong, Macao and Taiwan, which are integral to "Greater China" children's literature. *One Hundred Years of Hong Kong Children's Dreams (1920s–1950s)* edited by Zhou Mimi and *One Hundred Years of Hong Kong's Children's Dreams (1960s–1990s)* (Zhou, 1996) describe the basic aspects of Hong Kong children's literature and the scattered works of authors. The introduction also analyzes the progress of the history of children's literature in Hong Kong. Hong Wenqiong's study, *Taiwan Children's Literature History* (Hong, 1990) more clearly outlines the development of Taiwanese children's literature at different stages, and also explains the important works of writers in the form of special topics; for instance, Zhang Yongjian's work *The History of Chinese Children's Literature in the 20th Century* (Zhang, 2006) includes a special chapter, "Children's Literature in Taiwan, Hong Kong and Macau," which examines its unique historical development track and characteristics in more detail by means of overview and analysis of the writers' works. Regrettably, when outlining the development of children's literature in Hong Kong, Macao and Taiwan, the above researchers failed to analyze it in the context of the overall development of Chinese children's literature, resulting in a situation of separation and isolation.

Explorations in visualization in children's literation

As early as the Ming (1368–1644) and Qing dynasties (1636–1912), children's literary works with harmonious pictures and texts had appeared (Shen, 2012). In the early 20th century, some Chinese scholars had a deeper understanding of the relationship between picture stories and children's literature:

Pictures can sometimes form a story continuously, such as pictures in serial stories, and pictures in movies, etc. Words do the same thing. Pictures are an excellent way to use pictures to motivate children to appreciate literature.

Li (1962: 112).

In the 1920s, these picture stories became the new favorite in children's books, which had developed by leaps and bounds. While paying attention to children's literature, the May Fourth literati also attached great importance to the burgeoning picture stories in children's books, and many of the great writers also worked in the creative team of picture stories.

Zheng Zhenduo (1898–1958), who was a famous writer and poet, coined "picture story" as the new terminology for the journal *Children's World* in the first volume published in 1932. Meanwhile, Li Jinhui (1891–1967) writer of children's song and dance music, Xie Liuyi (1898–1945) writer and interpreter, Xu Dunggu (1892–1983) modern painter, and other artists and intellectuals made up picture stories for children. For instance, modern writer and educator Zhao Jingshen (1895–1985) wrote three representative picture stories, such as "A Pea," "Sister Mouse," and "To the Lilliputian Country" (Zhao, 1962). In his collected work, Zhao published his pioneering research *Theory on Children's Picture Story Theory* (Zhao, 1962).

At the same time, a representative figure who was regarded as one of a generation of masters of Chinese children's literature, Chen Bochui (1906–1997), wrote the article "Children's Literature Must Prosper and Develop" in his work, *Brief Discussion of Children's Literature* (Chen, 1982). In it, he stated:

Picture-story books are of course not 'decorating the facade' or helping to explain the content for children's learning, but as the subject to express ideas, which directly appeal to young children's senses more vividly than words. This can also be regarded as a feature of young children's literature.

Chen (1982: 79).

However, due to regressive notions of social development, the germination of children's picture-story books did not gain proper recognition again in China until the founding of the Republic of China. During 1950s and 1960s posters were made that were concise, expressive and stimulating; they were applied as a visual method to meet the need of political mobilization. Painters employed various political symbols in a unique way to express the ideology of the government. Deeply impacted by the genre, Chinese creators absorbed elements from Soviet posters and combined it with traditional Chinese New Year pictures, creating a large number of propaganda images with children as the theme. In the vast rural areas where educational resources were limited, children were encouraged to understand national policies, carry out health and disease prevention, and complete literacy tasks based on understanding these posters on the walls of schools and houses (Jiang and An, 2018). Given visual imagery is a powerful communication medium, children's propaganda posters had been centered on political tasks. For the state and society, there were no more important visual methods than the design of visual images representing the state and class to influence the psychological identity of children, and thus to generate cohesion to maintain the stability of power.

In contrast to the focus on children's propaganda, the 1980s saw a large number of art professionals devoting themselves to the creation of picture-story books. At the same time, the Chinese children literature was going through a period of great leaps forward, resulting in many excellent works of picture-story books for children; in fact, the publishing of picture-story books for children now flourished in unprecedented ways. In the 1980s, the publishing of children's picture-story books reached a peak in terms of variety, print volumes, and quality, which was the first developmental peak since the founding of New China. According to statistics, in 1980 more than 1000 topics of children's picture-story books and more than 400 million copies were published nationwide, and there were more than 2400 kinds, with more than 630 million copies just 2 years later (Chinese Publishing Almanac, 1983).

Influenced by the media and popular culture, the absorption and re-creation of popular culture began influencing illustration creation at this stage. Early on, Chinese children's picture-story books mainly borrowed the genre of Japanese popular culture while, at the same time, many artists were looking for inspiration from the fonts, graphics, colors and other elements in the Chinese traditional paintings works to refine artistic symbols.

As the creative element of illustration, representative visual cultural symbols were widely used. Some examples include: the picture book, *Fox Spirit in the Wasteland*, adapted by Cai Gao and based on a novelist in Qing Dynasty; and Pu Songling's (1640–1715) work, *Strange Tales from a Liao-zhai* (Pu, 1982), that depicts the fairy tale as a story of a child saving his mother and fighting wits and courage with a fox who pretends to be a human being, reflecting the uniqueness of Chinese storytelling's traditional cultural spirit. This latter work uses black and gray as the basic colors, highlighting the mysterious mood of the story. In another example of the use of color to portray mood, the protagonist in the picture, *Baoer*, wears red clothes, implying the belief that *Baoer* will win; the strong use of red and black emphasize the contest between good and evil, while the interlaced use of green, purple, orange and other colors provides beats, much like musical notes. The ingenious use of colors in these works together with

the design of the clothes for the characters and the architectural modeling of folk printmaking reflect the use of cultural symbols with Chinese characteristics.

At the beginning of the 21st century, due to the stimulation of the introduction of contemporary children's picture books from western countries and Japan, China's original children's picture books also gained new popularity. Even in ancient China, there was no such thing called a "picture book," since the creative form of coexistence of pictures and texts were a longstanding tradition; that is, there had always been a tradition of emphasizing the conveying and ideographic functions of pictures and texts. This creative tradition of complementary pictures and texts laid the foundation for the development of contemporary children's picture books (Xiang, 2017).

At the beginning of the 20th century, the child-centered view of children and childhood and concepts of children's literature emerged in unison. Children's literature writers were clearly aware of the existence of children's readers, and began to consciously write for children themselves, and a large number of children's literature works were published. Illustrations played a key role in these children's literature works. For instance, in Gao Shiqi's (1905–1988) popular science fairy tales, entitled *The Autobiography of Fungus* (Gao, 2017), and *The Food, Clothing, Housing and Transportation of Bacteria and Our Heroes Against the Enemy* (Gao, 2017), were illustrated with anthropomorphic images of bacteria and white blood cells by the creators. These titles were vivid, interesting and appealing. Similarly, the modern Chinese painter and cartoonist Feng Zikai (1898–1975) drew illustrations in Ye Shengtao's work, *Kaiming National Language textbooks* (Ye, 2018). Ye was a pioneer of Chinese literature education—his illustrations enhanced the visual sense of the textbook and stimulated students' enthusiasm for learning.

From the 1920s to the 1930s, a large number of children's picture stories were published in children's magazines. The most famous series picture stories were magazine named "Children's World" founded by Zheng Zhenduo (1898–1958), literary historian of Chinese vernacular literature. Some scholars pointed out that the budding of Chinese children's picture books should be the "columns of picture story" in the magazine, *Children's World*, published in 1922. These columns were published in forty-six serialized graphic stories which were believed to have been illustrated by Zheng, including the stories such as "Hippo Kindergarten" and "The Adventure of Two Little Monkeys," and were seen as suitable for children's reading given the comic strip format. Since these picture books were published in *Children's World*, many children's books were published with picture stories as an important component, such as *Little Kids* published in 1923, *Children's Morning News* in 1932, and *Children on Time* in 1939. These picture stories were developed with developmental psychology in mind, focusing on children's true feelings, and were in line with children's interests. These titles laid the foundation for the creation of modern children's picture books (Xiong, 2018).

In the 1940s, Zhang Leping (1910–1992), one of the pioneering manhua (Chinese comic) artists, created a series of works for young readers, such as *San Mao Joining in Army* (Zhang, 1940) and *San Mao Wandering Ji* (Zhang, 1940), also in the form of comic strips. Each page contains four pictures without text, relying on the changes across the panels to convey the storyline. Subsequently, in the following 20 years, *Journey to the West*, was adapted from an ancient classic work and created by Zhang (1983). In addition, other comic books, including *Little Doctor* created by Xiuwen, and *West Chamber* created by Wang Shuhui, appeared successively in 1940s, where they used pictorial language to tell one ongoing story. This large-scale publishing of comics has improved the status of children's picture books, and has also cultivated a group of readers for children's picture books, while becoming more popular.

After the founding of New China, children's literature became a tool for educating children for societal development. Under the influence of national policies, the number of graphic stories has not only increased greatly, but they have also been separated from magazines and adapted into discreet volumes. During this period, a very important work was born, namely Fang Yiqun's *The Carrots are Back* (Fang, 2008), which tells a warm story of small animals sending love to each other on a snowy day. It uses a combination of text and pictures, closer in form to the basic form of modern children's picture books.

In the 1960s, Taiwan began to introduce foreign picture book titles, mainly from the Japanese, which provided new references and a development impetus for its local picture book creation. In 1976, Taiwan's influential children's artist Zheng Mingjin, who was known as the godfather of picture books in Taiwan area, introduced Japanese children's picture books and also introduced the term "picture book" to Taiwan. In 1986, he published *On Japanese Children's Picture Books* (Zheng, 1986), which deepened the local people's understanding of the concept of picture books. Gradually, the publishing houses in mainland China also accepted the new term "picture book" (*Huiben*, 绘本, copied from the Japanese) as a replacement to the traditional term "picture-story book" (*lianhuan hua*) since 2010s (see Glossary in this chapter, Picture Book (*huiben*)).

At the beginning of 21st century, mainland China ushered in reform and, in opening up to the outside world, economic strength continued to improve and the publishing industry also flourished. Chinese elements and traditional cultural symbols were used by the writers and artists when they were engaging in creating children's picture books. Zhu Deyong, the cartoonist who comes from the Taiwan area, as well as other authors, adopted the form of "bubble painting", which uses speech bubbles with simple and interesting text within the four-frame comics. This unique painting style had been fostered by the children's literature field. Since the 2010s, Fubin Liao, who writes under the pseudonym "Jimmy" and who also comes from Taiwan area, has published picture books in mainland China inspiring fellow writers in mainland China with titles such as *Go Left, Go Right* (Liao, 2018) and *Listen to Jimmy Sing* (Liao, 2019). As children's literature scholars have pointed out, Jimmy fully adopts the narrative strategy of children's views, borrowing the perspective of children to observe the living faces of adults, and examining the adult world rationally and tenderly. Jimmy's picture books care for children's ontological world, explore childhood, and draw on the dynamic nature of dreams (Lin, 2017).

The creation of Chinese children's literature has emerged as a new field in the 21st century with the advent of the picture-book. On the one hand, this makes up for the long-standing gap in the field of Chinese literary creation in preschool children's literature and, on the other hand, it is also the result of the further deepening of the understanding of children by the creators of children's literature since the new century. The creation of children's picture books has undertaken many missions, including cultural inheritance, national identity, and esthetic cultivation (Kan, 2019).

At the beginning of the 21st century, picture books gained strong appeal in the children's literature market. Attracted by huge market interests, famous Chinese publishing houses, such as *Nanhai Publishing House*, *Tomorrow Publishing House* and *21st Century Publishing House*, have increased their efforts to introduce foreign picture books. Many excellent foreign picture books, including *The Tale of Peter Rabbit* (1901) written by Beatrix Potter from Britain, *The Cat That Lives a Million Times* (1998) by Yoko Sano from Japan, and *The Giving Tree* (1964) by Shel Silverstein, entered and blossomed in the Chinese market. The introduction of a large number of excellent children's picture books from Taiwan and abroad has not only enriched China's children's book market, but also opened a window for Chinese children's picture book creation, learning from the experience the Taiwanese and from foreign writers and illustrators (Hao, 2009).

In order to carry forward Chinese traditional culture and promote Chinese children's understanding of these images in picture books, the creators have accelerated their exploration of original Chinese children's picture books, resulting in marked achievements in the exploration of original picture books. In 2002, Jiangsu Children's Publishing House published the well-received series entitled *I'm Awesome: Picture Book for Children's Growth in Kindergarten*. From 2006 to 2008, Xiong Liang, Xiong Lei, Zhou Xiang, and Zhu Chengliang published many original books, which further sparked the trend of creating children's picture books. In 2009, the "Feng Zikai Picture Book Award" was founded and became a powerful encouragement in the further development and promotion of original picture books in China. In 2010, the Caterpillar Children's Book Center published the *Chinese Nursery Rhymes Series Picture Book*, which created a new period for the classic Chinese nursery rhymes. In 2012, Beijing Normal University Press took materials from traditional culture and launched the *Memory of China: Traditional Holiday Picture Book*. In 2013, People's Education Publishing House published the *Most Beautiful China Series Picture Book*, based on Chinese landscapes and customs. In 2015, Xinjiang Children's Publishing House launched the *Story of China Picture Book*, and in 2018, Chinese children's picture book creator Cao Wenxuan won the International Hans Christian Andersen Award. Under the efforts of the creators and promoters of Chinese original picture books, such works are becoming popular, influential and lucrative.

The difference between picture books and traditional children's reading materials in mainland China, as Peng (2012) argues, is that picture books convey the art of telling stories with drawings, which had been neglected by Chinese writers before the last century. The most important function of illustrations in picture books is to express the connotation of the story. The plots of the picture books are not only seen, but the pictures provide additional reading clues for children (Peng, 2012). The children are encouraged to imagine as they "read" the images, which convey both the storyline and the affective qualities. For a long time, the development of Chinese children's literature was not based on children's psychological and sociological features, but rather on the concerns of the adults' imagination and high expectations, which typically linked with political and social requirements. In contrast, the images and language of contemporary picture books, with the guidance of adults, helps children to recreate vivid and imaginative mental images for themselves. In the context of parent-child reading, the time and space created by the parent's voice and tone are valuable aspects of the reading process. Children not only hear the unique stories brought to life by the sounds, but also obtain meaning from the pictures. As Wang points out, is an indescribably beautiful process to acquire the stories from two different modes and experiences at the same time. Only in this way can the function of picture books be brought into full play; that is, on the basis of increasing children's sense of pictures, which can be transformed into a rich sense of language (Wang, 2011).

Conclusions: popular and unique characteristics of Chinese realistic children's literature

In the past 100 years, the development of Chinese children's literature shifted from a process of manipulating children to discovering children and finally to supporting children's development. In this process, children's literature was influenced by the impact of war and political influences. During 1930s, the children's literature was booming as a "political fairy tale", which was then transformed as the "children's literature in the war" during the World War II (1931–1945). Behind the transformation in children's literature was the view of children in the context of Chinese modern history, which resulted children's literature undergoing several twists and turns. Over the past more than 100 years, it has witnessed the struggle for the child-centered theory, the disputes between class and children, the debates among aims of education and literature, and the process of re-understanding children in culture in the 21st century. At the end of this 100-year exploration is the beginning of a return to the original purpose. In contemporary China, child-centered theory is still developing in schooling and family education; there has not yet been a Chinese child psychologist the likes of Piaget, nor a master of children's literature education. As this chapter illustrates, the development of Chinese children's literature is still facing the challenges of the times, and it is important to continue to reflect on the "child-centered theory", to understand the world of children, and to truly establish a new concept of "children" and children's literature in China.

Introduction

Greek and Greek-Cypriot literatures for children and young adults are rich, adventurous, and socially aware literatures. As such, they deserve to be translated and made available to readers across the globe. Young readers should not be deprived of the playful joy and global awareness that these books can bring into their lives. This paper contributes to informing international scholars and educators about Greek and Greek-Cypriot literatures for children and young adults, thus encouraging them to explore and share their worthwhile literary texts transnationally. The International Board on Books for Young People (IBBY) and its peer-reviewed journal *Bookbird* have been playing a crucial role as champions of Greek, Greek-Cypriot, and other diverse literatures from around the world. This paper draws heavily from multiple *Bookbird* and IBBY sources that have continually made the world aware of talented Greek and Greek-Cypriot creators and their work. My article in a 2018 special *Bookbird* issue that focused on children's literature from Greece, Cyprus, and Turkey (Panaou, 2018), along with other articles published in the same issue, form the basis for this paper.

Historical development of Greek children's literature

According to Anagnostopoulos (2004), *Old Stathis or Memories of My Childhood* (1858) by Leon Melas was the work that marked the true starting point of children's literature in Greece. Throughout the book, Old Stathis, a sweet and fatherly figure, tells children stories from the Greek tradition, history, and mythology, lovingly advising them on how to lead a life of virtue and become socially responsible citizens. Melas' work was highly influential in developing the educational and aesthetic framework for the development of Greek children's literature. During the 19th and well into the 20th centuries, ethical, religious, and national edification was the main focus of Greek texts addressed to children (Anagnostopoulos, 2004).

As interest in educational matters grew in Greece, children's literature benefited mainly through the proliferation of children's magazines. One of these magazines, *The molding of youth* [I diaplasis ton pedon] was founded in 1879 and influenced the production of children's literature for the following seventy years. It rallied around itself prestigious authors who published their work in the magazine and dynamically promoted children's literature in Greece (Anagnostopoulos, 2004). Circulating thousands of copies of each issue, *Diaplasis* included a broad spectrum of texts, from poems, to fables, to short stories, and novels in periodical installments. Scholars have praised the magazine's longevity, originality, content variety, artful illustration, and appeal to the child's psyche, as well as the masterful ways in which it used simple but aesthetically pleasing language to cater both to the child reader's instruction and delight (Patsiou, 1995, p. 103). During the same time, anthologies of children's poems for school use, as well as translations and adaptations of international works by authors such as Verne, Dickens, and Twain, offered inspiration for a Greek literary tradition of children's and young adult literature.

In the first decades of the twentieth century, historical events such as the First World War, the Balkan Wars, and the Asia Minor Catastrophe, along with conflicts around language issues and educational reform, shaped Greek education and children's literature (Anagnostopoulos, 2004). An important development was the pioneering and establishment of the historical novel as a children's literature genre by Penelope Delta (1874–1941) with works such as *For the motherland* (1909) and *A tale with no name* (1910). *For the motherland* is a historical novel that takes place during the Byzantine era and is packed with adventure, patriotic heroism, romance, and suspense. Even though *A tale with no name* is fantasy, it espouses similar ideals, such as heroism and patriotism. It is the story of a young prince, who saves his father's deteriorating kingdom and leads it victoriously through battle and toward rebuilding and peaceful prosperity. While these works were quite didactic, they also told moving and delightful narratives that engaged young readers' interest.

The springtime of children's literature in Greece

Tsilimeni (2004) identifies the predominance of comic books, illustrated classics, and cheap popular publications, along with an effort to provide children with books that were distinctively Greek, as the two main trends during the post-Second-World-War period. In the decades that followed, Greek children's literature began to mature, but it was not until the 1970s that it truly bloomed. It was at this time that literary production in Greece developed dramatically, both in quantity and quality, breaking away from didacticism and addressing the young reader's critical thinking with respect. Tsilimeni explains that the period from 1969 to 1980 is considered the springtime of children's literature in Greece. Two important factors for this springtime were the reinstatement of democracy in the country and the institution of Demotic Greek (the language spoken by the people at that time, rather than the archaic Katharevousa language) as the official state language. Other factors included the introduction of children's literature as a course/discipline at Greek Universities, the publication of the first studies on children's books, and the activity of literary societies such as the Circle of Greek Children's Books (the Greek national section of IBBY).

Ada Katsiki-Givalou (2002, p. 47) recognizes Alki Zei as one of the most influential authors in the development of children's literature in Greece from the '70s and onwards, especially after the collapse of the dictatorship in 1974. Givalou sees the transition to democracy, liberal educational theories and reforms, and cultural convergence with Europe as conditions that formed Greek authors' focus on child perspectives and their "conviction that the child is an equally important member of society, participating in the community's socio-political affairs, observing scientific and other developments, and forming his or her own personality and character" (p. 48).

Zei's works—including *To kaplani tis vitrinas* [Wildcat under glass] and *O megalos peripatos tou Petrou* [published in English as *Petros' War*]—have been widely translated and internationally published. *Wildcat*, which was first published in 1963, features child characters who experience fascism and dictatorship. In *Petros' War* (first published in 1971) children experience life in Athens, Greece under Italian and then German occupation during World War II. Zei was impressively skilled in authoring stories from a child's perspective (p. 48) as well as in incorporating delightful humor, even as she wrote about serious subjects, such as war, addiction, oppression, and intergenerational conflict (Freeman et al., 2004, p. 41). Here is how the author herself explained her commitment to child perspectives:

I believe, I am actually convinced, that a decisive factor for the success of a book for children is the writer's ability to truly assume the role of the child, i.e., to see everything through the eyes of a child who writes. I remember once seeing an English film, a detective movie, in which the main character was a ten-year-old boy; the entire film was shot from the point of view of the child, furniture appeared larger than normal, everything was above the child's eye level. This has turned into a guiding principle for me. If one succeeds in this, then the book will work, then everything will click into place.

Qtd. in Katsiki-Givalou (2002, p. 48).

In addition to Zei, Givalou mentions several other Greek authors who started to create critical and socially aware young characters in their stories during that time and beyond, including Zorz Sari, Litsa Psarafi, and Pantelis Kaliotsos. The main trends were toward realism, the projection of values with an international character, reference to space and technology, and to the natural environment. Novels became the dominant form and featured dynamic treatments of contemporary global problems, social and political events, and the relationship between humanity and the environment. Poetry also followed new paths in both form and content and children's theater developed radically, as it was freed from its close ties to education (Katsiki-Givalou, 2002).

According to Tsilimeni (2004), the didactic element virtually disappeared from Greek children's literature in the 1990s, the predominant elements becoming entertainment along with social, environmental, and international issues. To this day, contemporary Greek children's literature continues to respond to the call of our times by cultivating in young readers an optimism for life, an appreciation of love in human relationships, and the value of peaceful communication and co-existence between peoples and communities.

Greek-Cypriot children's literature

Interestingly enough, Greek children's literature on the island-nation of Cyprus also bloomed from the 1970s and onwards, but not due to the fall of the dictators in Greece. During that same time, tragic, traumatic events took place in Cyprus. A military coup that was directed by the Greek dictators was followed by a Turkish military invasion and occupation of a large part of the island. These events changed the course of Greek-Cypriot children's literature. "Ironically, one of the darkest moments in the modern history of Cyprus brought the booming development of its literature" (Panaou and Michaelides, 2010). Passing through stages of anger, mourning, and hope, numerous authors—with Kika Poulcheriou and Maria Pyliotou being the most prominent ones—wrote children's literature that was inspired by the tragic stories they had witnessed, the trauma that both children and adults had experienced, and the challenging times that followed.

In a special *Bookbird* issue that focused on Greek, Greek-Cypriot, and Turkish children's literature, Chatzianastasi (2018) looks at one aspect of this literary production, examining how representations of enclavement (the experience of small Greek-Cypriot communities living in isolation within the Turkish-occupied area) explore traumatic experiences and help create new frameworks of understanding trauma. And in their IBBY Congress presentation, Katsonis and Kyriakides (2008) examine fifteen story collections

(a total of 126 short stories by sixteen different authors) that revolve around the 1974 war and its implications for every aspect of life on the island. They identify four thematic strata in these stories:

- Cultivation of love for democracy as a response to the coup that preceded the war
- Cultivation of pacifism and anti-war stances, along with preservation of memories from the occupied lands
- Reference to the loss of beloved ones and the remembrance of missing persons
- Endorsement of peaceful coexistence between the Greek and Turkish communities on the island and encouragement of hope for a settlement of the Cyprus problem.

Katsonis and Kyriakides (2008).

Michaelides and Panaou (2010) view Greek-Cypriot children's literature as a minority literature, existing in the periphery of metropolitan Greek Children's Literature, striving to establish its place within the European and international literature. Greek literature published for children on this island has historically managed to progress in spite of illiteracy, colonialism, war, marginal cultural status, identity crisis, and language confusion (because of the marginalization of the Greek-Cypriot dialect); this persistence reveals the strength of the minority culture it is stemming from and the will of those involved to help it achieve the status it deserves (Panaou and Michaelides, 2010).

Antri Antoniou, a young author belonging to a new generation of prolific Cypriot creators that matured during the period following Cyprus' inclusion in the European Union, says "Cypriot children's literature merits recognition and respect. During the past couple of decades, a substantial number of young Cypriot authors have been writing texts that are of equal quality with good books authored by writers who live in Greece" (Charalambous, 2018). Indeed, from the beginning of the 21st century and onwards—a period that Michaelides and Panaou (2010) call "The Era of Europe" as Cyprus officially became an EU member state in 2004—an entire new cohort of Greek-Cypriot authors have been creating literature of impressive quality and innovation. Several of their works, including texts by Antri Antoniou, Anna Kouppanou, Marina Michaelidou-Kadi, Elena Perikleous, Demetra Charalambous, Despina Eracleous, Fytoula Vakana, and others have been successfully published in Greece, where they have also won prestigious awards.

Cyprus' 2022 Hans Christian Andersen author nominee Anna Kouppanou, for example, is celebrated both in Cyprus and abroad. Her novel *The incredible discovery of Sebastian Montefiore* was awarded the Republic of Cyprus State Award for Young Adult Literature as well as the Anagnostis (Reader) award in Greece. The same book was included in IBBY's Honor List in 2018. Kouppanou's literary work encourages interspecies coexistence and respect for difference, while calling for social change. She believes that children face much hardship, which often ensues from the way adults fail to understand and communicate with them. Her books strive to fill in this gap (Mathis and Panaou, 2021, p. 17). In her own words, her books aim "to offer a space in which children can experience moments of safety within a world that is just coming into being, a world that invites them to think for themselves and to change it—if they wish to do so" (p. 17).

Anna Kouppanou's work is often organized through a creative combination of the real and the imaginary, drawing on enchanted and mythical elements that take on new meanings. Along with *The incredible discovery of Sebastian Montefiore*, her works *The argonauts of time* (Republic of Cyprus State Award), *The day we broke the world* and *To the dark of darkness and beyond* contribute to the renewal of themes and narrative techniques in children's fantasy, not only in Cyprus but also in Greece. And with books such as *Grandpa, Superman, and a little cherry* and *The disappearance of Mrs. Papadakou* (nominated for the Hellenic Republic State Award; short-listed for the Republic of Cyprus State Award and the IBBY Greece Award), Kouppanou innovates realistic fiction, engaging important psychological, philosophical, and social issues while depicting childhood and adolescence in contemporary terms. In her acclaimed picturebook *O Fivos ke i falena* [Fivos and the whale], for instance, a young boy named Fivos gives shape to his overwhelming sense of fear, turning it into a whale and releasing it in the sea. In this manner, he makes room in his heart for other things/emotions.

Sandra Eleftheriou, a member of this new cohort of creators, was the first-ever illustrator to be nominated by the Cyprus branch of IBBY for the Andersen award. Like the rest of her cohort, playfulness is central in her work: "What instantly wins the reader's interest is the illustrator's playfulness. She plays with her drawings, with colors, figures, and shapes the way a child would play, and it's this playful mood that gives the text she is illustrating a new dimension" (Panaou and Mathis, 2019, p. 22). A small number of texts by these artists has been translated and/or included in international lists. The European influences on their work are evident, as are the influences from metropolitan Greece. Pavlos Ioannides writes: "Although Greek Cypriot literature reflects the way of life, history, feelings, hopes and dreams of islanders, it is strongly attached to, and affected by, the literature of Greece" (2002, p. 2).

The talent and influence of Eugene Trivizas

Perhaps no other Greek children's literature author has been more influential to his peers, in Cyprus and in Greece, than Eugene Trivizas. Christie Davies writes about Trivizas: "He is justly celebrated in his native Greece, where he has been described by reviewers and commentators as a 'miracle worker who brings to life a whole new world based on imagination,' 'a revitalizing force in Greek children's literature,' 'the most important heir of Rodari,' and 'a classic writer whose books belong in each and every library'" (2003, p. 23). Writing in 2003, Davies praises Trivizas' international appeal and predicts a stellar international career, which never came; at least not to the extent that critics had expected it would.

The most talented and prolific Greek author of our times (with more than 150 works) seems to currently only have one book in print in English. This is *The three little wolves and the big bad pig* (1994), illustrated by Helen Oxenbury and concurrently published in Greek and English. It has been translated in more than 20 languages, is an international bestseller, and has won multiple awards. *The three little wolves* retells the classic *Three little pigs tale*, reversing the roles of the main characters and subverting the moral universe of the story. Rather than ending with a harsh punishment of an evil adversary, Trivizas' imagines a world where beauty, friendship, and kindness prevail and function as agents of change. It is a masterfully told, humorous, and playfully subversive fractured fairy-tale, but Trivizas' other works—including *The last black cat* (2012), which has been published in English but is currently out of print—are equally deserving of being read across the globe. *The last black cat* is a fantasy novel set on a distant island, where the powers that be convince people that black cats and the bad luck they bring are to be blamed for everything that is wrong on the island. The main characters, a black cat and a young girl, fight against all odds to put an end to the persecution and violence that ensue. Reminiscing of the persecution of Jews by the Nazis, Trivizas' powerful story is a warning that "people forget and it doesn't take much for madness to return" (Trivizas, 2012, p. 358).

Davies attributes the greatness of Trivizas' work to three elements. First, to his gift for humorous play with risk, fear, and danger, as well as with incongruity and nonsense. Next, to the way in which his writing operates on multiple levels, engaging readers of diverse ages. And finally, to his ability to transform the familiar, spinning traditional stories, well-known images, and everyday words in unexpected and comic ways (Davies, 2003, p. 23). Yannicopoulou (2007) writes about the interactive, hypertextual elements in Trivizas' fiction, Kanatsouli (2012) praises the use of play in his work, and Athanasiou-Krikelis (2018) analyzes the brilliant ways in which Trivizas subverts power and authority.

Traits and trends of Greek children's literature

All of the above have been influencing Greek and Greek-Cypriot authors, even though one should not, of course, attribute all innovation and narrative playfulness to Trivizas. In fact, Davies argues that it was the openness of Greek children's literature to fluidity and experimentation that enabled Trivizas to thrive in the first place: "In a less adventurous, more restrictive, less aesthetically aware culture, a children's and adults' writer like Trivizas would not have been given this chance to succeed" (2003, p. 31). Writing about contemporary Greek illustrated books for children, Alexandra Zervou asserts that they engage in "an unending game of opposites: it is a meeting point of the world of adults and the world of children, of tradition and innovation, of dreams and real events" (2002, p. 6).

Tradition and innovation, the second game of opposites listed by Zervou, is also identified in the work of Greek illustrators by Elena Popova, who observes that they successfully merge classic styles with "the synthetic language of modern art" (2002, p. 40). Tradition and innovation, sometimes merging and sometimes struggling with each other, form a central feature of contemporary Greek literature for young readers. Kanatsouli and Tzoka discuss a selection of contemporary texts that take the traditional concept of Greek national identity and evolve it into a more "multicultural view of Greekness" (2005, pp. 32–33). Papantonakis (2004) explains how contemporary Greek science fiction for youth reconciles the seeming opposites of national and global awareness. Both of these articles, for instance, discuss stories in which the protagonists retain their Greek identity while upholding universal values and striving for the global good, sometimes collaborating with people of other ethnicities to achieve that.

Tsilimeni and Panaou (2011) divide contemporary Greek poets for children into those whose work could be described as traditional poetry and those who stray from traditional paths, in order to free their work from conventional forms, subjects, and functions. In the past few decades, for example, an increasing number of poets have been exploring nonsense, humor, and parody, and are constantly eager to play with language. Theti Chortiaty is an important poet who plays with all of the above. Chortiaty started her writing career with traditional poems, but soon turned to radically different kinds of poetry that make heavy use of language play, alliteration, neologism, portmanteau techniques, and so on. In the following sample of her work from her poetry collection *Pechnidolexa* [Playwords] (1986) she joyfully and nonsensically plays with homophones (underlined):

I giagia psomi zimoni
Ke sto spiti zi moni

[Grandma bread bakes]
[And in the house she lives alone]

Similarly, Politis (2018) places Greek children's literature at the end of the 20th century in a middle-ground between Modernism and Postmodernism, identifying renewed writing styles and an adaptability to the needs of present-day readers. Politis explains how authors like Manos Kontoleon, Eugene Trivizas, and Christos Boulotis use postmodern techniques to offer readers multiple perspectives and diverse realities. In his novel about the life of a family *To 33* [The 33], for instance, Kontoleon concludes a multifocal narrative that is characterized by frequent narrative ruptures by inviting the reader to provide the ending they prefer. And Trivizas' *Ta 88 Dolmadakia* [The 88 Dolmas] could be described as an entirely meta-fictional/experimental text as it relinquishes to the reader the responsibility of connecting its narrative parts and making them work. Depending on the narrative option they select at the end of each page, readers may create a new story every time they read the book (a total of 1921 different possible stories).

Vagelis Iliopoulos, the 2018 Hans Christian Andersen Greek author nominee, is also described as a writer who is “always experimenting with the form and meaning of words” and “does not hesitate to apply pioneering narration techniques” (Sundmark, 2017b, p. 22). And the 2018 illustrator nominee Christos Dimos observes the past with a sensitive eye to produce images that “enlighten present eyes about the future” (Adamopoulou qtd. in Sundmark, 2017a, p. 53). For contemporary book creators in Greece, this enlightenment about the future often requires critical questioning and social change. Maria Papayanni, Greece’s 2022 Andersen author nominee brilliantly summarizes this approach: “No, a book cannot change the world. But it can open Aeolus’s bag of wind; it can unleash new winds and give birth to new questions. A book can lure young readers to the forest of life, where they can search for answers that will lead to a more just society” (Mathis and Panaou, 2021, p. 25).

As mentioned earlier, the purpose of this chapter is not to cover the entire history or current state of Greek and Greek-Cypriot children’s literatures. It rather aims to introduce its readers to the production of Greek literary texts for young readers in Greece and Cyprus and convince them that young readers across the globe should not be deprived of the playful joy and social/global awareness that can be found in these books. Davies writes: “Trivizas’ work deserves to be more widely known. Who knows how many more potential international bestsellers are lurking in the treasure chest of this remarkable author?” (2003, p. 34). The same could be said about the wider treasure chest of Greek and Greek-Cypriot literary production for children and young adults.

Introduction

The history of children's literature is as strongly intertwined with the development of education and schooling in the Arab world, as it is in any other context. More specifically, the spread of mass schooling in the twentieth century made the decipherment of written text possible for a large majority of the populace, dramatically expanded the market for books, and contributed to the creation or enlargement of national middle classes to which most writers and buyers of books continue to belong. Conversely, the scholastic market strongly asserts itself as the main market for Arabic children's books today, especially as neither public libraries nor individual consumers currently constitute a critical buying mass. It is exactly this symbiosis and the tensions between consumer publishing and the scholastic book market that this article examines as it approaches the Arabic children's book, in particular the Arabic language picture book, as an educational artifact that rests at the heart of a complex ecosystem.

We break down this ecosystem in the first half of this article (Section **The Arab picture book ecosystem and its opportunities**). We start with an overview of the Arabic children's publishing field (Section **The Arab children's publishing scene**), the scholastic landscape in the Arab world (Section **The scholastic landscape in Arab countries**), other relevant actors (Section **Other active agents in the ecosystem**) as we advocate for greater coordination and cooperation among these various nodes, as well as make recommendations for reading promotion (Section **Trends and opportunities**). In the **Inside the book** section, we examine the form of Arabic picture books, including language, rhyme, illustration and design from a pedagogical angle.

The general consensus in the Arab world is that the function of children's literature is primarily as a socialization tool which provides an esthetic literary and artistic experience, teaches the children something about themselves, promotes linguistic, mental, moral and sensory development and aids emotional maturity and psychological adjustment to the world (Kenawy, 1994, 28). This entry does not survey or make commentary on the content of picture books at this time, as this is a sizable endeavor, and has been partially dealt with by Chèvre (2015), in her overview of 40 years of Arabic picture books in Egypt, Lebanon and Syria, and Motawy (2021) in her ideological analysis of three main themes in Egyptian picture books in the last two decades.

The Arab picture book ecosystem and its opportunities

The ecosystem depicted below, with the book reader at its center, pictorializes the various parties who act upon the reader and their relationships with one another, recognizing that many more relationships are possible, and that the qualitative dynamics between them require elucidation. This visualization facilitates the identification of weak nodes and potential relationships and flows that can improve the reader's access to, and utilization of quality picture books (Fig. 1).

The Arab children's publishing scene

Arabic is an official language in twenty-five countries. These include the twenty-two countries that are members of the Arab league as well as three other countries. There are also Arab diaspora communities as well as others invested in reading Arabic, learning the language or teaching it to their children, whether for religious, cultural, personal, or professional reasons. With the lack of comprehensive histories, statistics, and bibliographic documentation of Arabic books for children, a large-scale pan Arab scholarly collaboration is needed if the entire Arab world is to be covered. As such, in the interest of attainability of scope, this article focuses on the

Fig. 1 The picture book ecosystem.

production of the main book publishing nations in the language bloc. We additionally focus on general trends in the field and attempt to be as inclusive as possible in our choice of examples.

The Arab book market is, on the one hand, an aggregation of twenty-two different national markets, each with its own particularities; on the other hand, there is also a regional market due to the status of Standard Arabic as the shared macrolanguage of reading and publishing. This makes the entire Arab world a potential market for an Arabic book and enables artistic collaborations, where the publisher, author, and illustrators may be from different Arab countries. Furthermore, different countries play unequal roles in publishing and buying Arab children's books although these roles may also change and shift in response to regional and international political and economic developments. In general, Egypt and Lebanon, notwithstanding economic and political shifts, are the two countries with the longest publishing and printing traditions as well as the major producers of Arabic children's books. In terms of book buying, the market currently skews toward the oil rich, member countries of the Gulf Cooperation Council (GCC), especially the Kingdom of Saudi Arabia, the United Arab Emirates and Kuwait. As a result, the markets in these countries are a main target for many publishers, alongside their national markets.

Starting in the new millennium, there has been a new wave of production of Arabic picture books (Chèvre, 2015; Motawy, 2021). By the mid 2000s, many new publishing houses were being founded as already established publishing houses began to take or renew their interest in publishing for this age group. This coincided with the emergence of a new generation of authors and illustrators, as new authors and illustrators continue to enter this field. What also played a role in this renaissance was institutional support, whether in the shape of the establishment of national and regional book prizes, or financial support for training workshops and projects in the field of children's literature and reading promotion although some of these programs have since ended. This new wave was especially prominent in countries such as Egypt, Lebanon, the United Arab Emirates and to a lesser extent Jordan, Palestine and the Kingdom of Saudi Arabia. While the war in Syria affected book production in the country, Syrian publishers, authors and illustrators still play an important role through their contribution to books published in other Arab countries or their establishment and/or relocation of publishing houses to other Arab or European countries.

Arab publishers for children tend to be either state institutions, private sector publishers or NGOs. Among Arab state publishers, the most prominent and influential is the General Egyptian Book Organization (GEBO), part of the Egyptian Ministry of Culture. It is one of Egypt's largest publishers, and additionally sponsors the "Family Library" initiative which subsidizes the republication of curated books at highly affordable prices. The GEBO behemoth aside, most prolific publishers of Arabic children's books tend to be private sector companies, both general interest publishers as well as specialized publishers. The majority of these publishers are small to medium-sized institutions, mainly family-owned and operated and include several one-woman shows (Stephan-Hachem, 2010). There is also a noticeable trend of publishing houses established and headed by children's authors (Stephan-Hachem, 2010; Kreidieh, 2015), such as Taghreed Najjar (Al Salwa Publishers, Jordan), Abeer Al-Taher (Dar Al-Yasmine, Jordan), Amal Farah (Dar Shagara, Egypt), Weam Ahmed (Aliareach, Egypt), Amal Naser Kojok (Dar Rummana, Lebanon), Nabiha Mheidly (Al Hadaek Group, Lebanon) and Arwa Khmayyis (Dar Arwa, Kingdom of Saudi Arabia). The most prominent NGO publisher is Tamer Institute for Community Education (Palestine).

While possessing a certain dynamism, the Arab publishing scene also faces a number of challenges, including a vulnerability to external events, instability, and distorted structures. Due to the relative ease and low cost of establishing publishing houses, new publishers may regularly emerge but existing ones also disappear or become inactive. In addition, there are often no clear divisions

of roles within publishing houses or between publishers and distributors. Many heads and founders of publishing houses carry out roles that should be assigned to editorial committees or marketing teams (Kreidieh, 2015, 193). More challengingly, most publishers are also the main distributors of their books, due to inefficient distribution networks, mistrustful relationships with distributors, or the very large cuts often taken by the latter, between 40 and 60% of the cover price (Arab Thought Foundation, 2008, 446; Stephan-Hachem, 2010, 111; Eschweiler and Goehler, 2010, 195). This places a great strain on publishers in terms of human and financial resources and often restricts marketing opportunities in other Arab countries to distributor and bookstore collaborations that come out of personal connections, co-publishing agreements with other publishers, or selling books directly to clients during Arab book fairs. The lack of a unified or centralized pan-Arab distribution system is further hampered by the lack of free movement between many countries, currency exchange rate differences which make a book affordable in one country but expensive in another, and high shipping costs (Arab Thought Foundation, 2008, 446; Stephan-Hachem, 2010, 111; Eschweiler and Goehler, 2010, 195). For these and other reasons, most print runs are in the range of 1000–3000 books and stocks often take several years to sell (Kreidieh, 2015, 138).

An additional bottleneck to book distribution is the not fully realized role of public libraries in the Arab countries. While most countries do have library networks, these do not keep pace with population increases, and often exclusively exist in large urban centers, leaving the rest of the country to be served by mobile seasonal libraries, if at all. Additionally, in countries with budget constraints, libraries suffer from outdated collections, untrained librarians, and a host of infrastructural issues. One of the findings in the research carried out by Kreidieh (2015) is the important role that libraries played in exposing many of the parents she surveyed in countries such as Lebanon and Tunisia to titles they would not have been aware of otherwise (221 and 233). This supports the argument made by Stephan-Hachem (2010) that the health of the book industry depends on all the elements of the chain of book production and distribution, including libraries (131).

This state of affairs has implications for book content and the equity of access to books. The challenges of selling even relatively limited print runs put many publishers in the position of needing to play it safe, sometimes at the expense of originality, to avoid potentially controversial content and to favor didactic sure-sells over more playful books. In addition, publishers evenly straddle considerations of authenticity versus regional commercial reach and often exclude from books any material that might be deemed too “local”, whether it be the inclusion of dialect, local minority languages, or references and landmarks that might only be familiar to residents of a particular country. In terms of access to books, this is highly dependent on geographical location and circumscribed by a number of factors, including the number of active publishers in the country in question, the extent to which existing distribution and cooperation links allow access to books from other Arab countries. Expectedly, those residing outside urban centers have far less access to bookstores, which hinder their ability to buy books, even ones published in their countries (Stephan-Hachem, 2010, 141–142; Eschweiler and Goehler, 2010, 197).

The scholastic landscape in Arab countries

In spite of the growth of mass schooling and attention to education following the independence movements that swept across the different Arab countries in the twentieth century, a number of Arab countries continue to struggle with various rates of adult and youth illiteracy to this day (UNICEF, 2021). With the diverse trajectories taken by the educational systems in the different countries, the scholastic landscape in the region is characterized by diverse curricular priorities and educational practices as well as a wide panorama of school categories. These include public or state schools; private school; hybrid forms (e.g. government-subsidized private schools), religious schools (e.g. Azhari religious schools in Egypt), branches of international schools, language schools, community schools, or schools tied to UN agencies that serve refugees in various countries. Within this context, differences in the role assigned to Arabic children’s literature and the access children would have to such books is affected by a number of factors, including the priorities of the national Arabic curriculum, the nature and pedagogical orientations of the school and available financial resources or subsidies.

Increasingly, the Arabic language and literature curricula in various countries are including the “promotion of voluntary reading” within their educational objectives. However, it is often mentioned alongside many other objectives that are more focused on literacy acquisition (decoding, comprehension, writing etc.) (UAE Ministry of Culture, 2020). This is an acknowledgment of the important role that reading and children’s literature can play in developing literacy, a fact underlined by a number of recent reports on Arabic literacy and reading pedagogy (Gregory et al., 2021; UAE Ministry of Culture, 2020, 362; USAID, 2019). It also relates to the dominant role assigned more generally to books to develop Arabic literacy, to the detriment of other potential roles of literature in general, and the visual literacy that picture books specifically enable. For the most part, the Arabic curriculum equates to the Arabic language textbook (UAE Ministry of Culture, 2020, 362; Gregory et al., 2021, 30; USAID, 2019, 58), and literary excerpts within scholastic textbooks and required readings, sometimes in the form of picturebooks specially created by curriculum designers to teach particular concepts, seem to constitute the totality of the literary experience of many school children with little time dedicated to independent reading (Gregory et al., 2021, 38–39; USAID, 2019, 18). Some children’s book publishers are also running their own textbook series and publishing other materials to teach literacy (e.g. Antoine’s Bookstore, Lebanon; Nahdet Misr, Egypt; the Hurouf imprint of Kalimat, the United Arab Emirates). Any deviation from this general rule is often an outcome of individual initiatives at the level of educators, schools, or voluntary involvement in external projects that seek to promote reading and children’s literature (see **Other active agents in the ecosystem** section below). Having said that, publishers are reporting an increase in the awareness among schools of the important role of Arabic children’s books and interest in acquiring such books in the past two decades.

Notwithstanding the untapped potential, the scholastic market remains of primary importance to children's book publishers, and better endowed private schools are more likely to curate school libraries, but by virtue of numbers alone, public schools purchase more textbooks. When there is a policy of using public funds to purchase books, ministries of education in countries like the UAE purchase large quantities of selected titles for school libraries or for individual students, with similar processes occurring in some other GCC countries. In less affluent countries, civil society or international aid organizations might furnish these although in a more inconsistent manner. Ultimately, access to high quality books falls along class as well as national lines, and school and class libraries are, for the most part, either absent or poorly resourced and under-utilized (UAE Ministry of Culture, 2020, 362–363, 372; Gregory et al., 2021, 37; USAID, 2019, 61 & 57).

Additionally, education in almost all Arab countries is multilingual, and proficiency in either English or French is highly valued. This may be the outcome of a colonial legacy, cultural globalization, or the influence of the sizable expat communities notably residing in the GCC countries (Zakharia, 2015). This has implications concerning the extent to which private schools are choosing to invest in promoting reading in Arabic and how it fares in comparison with their investment in teaching and promoting reading in European languages. Translation of works into Arabic accounts for a significant part of Arab children's publishing, although we argue that the last two decades of increasingly high quality original production, along with unfavorable currency rates (vis-a-vis Europe) in countries such as Egypt, Lebanon, and Sudan that have experienced devaluation, are turning this tide.

Other active agents in the ecosystem

Beyond publishers and the various actors involved in the educational system, there is a constellation of other organizations as well as individuals that carry out a range of roles, some of which aim to develop children's literature, bring books to children, and promote reading. These organizations could be public agencies, non-governmental organizations, or even academic or research centers. Examples include the National Sections of the International Board on Books for Young People (IBBY) in five Arab countries: Egypt, Jordan, Lebanon, the United Arab Emirates and Palestine. The activities organized by these organizations include book-gifting schemes, book prizes, research and conferences on children's literature, training workshops for authors, illustrators and publishers, the management of libraries, the acquisition of books, and the organization of storytelling and book-based activities with children. In addition to these organizations, there are individual actors including trainers, book critics, storytellers, and edutainment animators, many of whom count on work with private schools, public libraries and NGOs.

One prominent example of such an NGO is the Integrated Care Society which, in coordination with GEBO, launched "The Family Library" project and the "Reading for All" campaign in Egypt in 1991. These State funded initiatives helped establish countless libraries and print millions of copies of curated books, including children's books. The Suzanne Mubarak Prize for Children's Literature connected to these initiatives was highly instrumental in launching a new generation of writers and illustrators in the 1980s and 1990s. The campaign and prize ended with the ousting of former First Lady Suzanne Mubarak in 2011, although the Family Library project is still run by GEBO. Another example is the United Arab Emirates Board on Books for Young People (UAEBBY) which manages the prestigious Etisalat Award for Arabic Children's Literature and carries out training workshops with authors and illustrators among its many other activities. In addition to publishing books for children, Tamer Institute for Community Education in Palestine also organizes training workshops for authors, illustrators, librarians and animators, carries out book discussions and other activities with children, and supports academic research on children's literature.

There are some initiatives that directly seek to support reading at schools. For example, Ana Aqra' Association in Lebanon has succeeded in creating class and school libraries in public schools, training teachers on reading aloud and developing literacy and currently works with the Syrian refugee student population in the country. On a more regional level, the Arab Thought Foundation created a leveled reading scheme with its Arabi 21 project. The Arabi 21 label that categorizes books according to reading difficulty is sought by publishers as these make their books more attractive to schools. Another example is the Arab Reading Challenge launched by the Foundation of Mohammed Bin Rashid, the ruler of the Dubai Emirate, a reading marathon among school children with the purpose of promoting reading. Students keep passport-like reading journals of the books they have read and summarized in 1 year, with winners selected. The competition has undoubtedly galvanized schools to devote greater attention to reading, with millions of students in Arab countries and the diaspora participating, more than half of them elementary students (UAE Ministry of Culture, 2020, 370–372). However, the educational impact of this initiative has yet to be systematically assessed.

Trends and opportunities

From the overview presented so far, it becomes clear that there is, on the one hand, great potential and many passionate advocates for Arabic children's literature and reading promotion. However, this potential is undermined by the lack of sustained financial support for projects and book buying, a comprehensive vision related to the development of children's literature and reading promotion, or deliberate reading promotion policies. We also observe that a major issue in the Arabic picture book ecosystem is the inefficient coordination among its various parts which stands in the way of bringing the book and the child together. Some of the actors that we have discussed above have begun to specifically address this disconnect. In what follows, we will highlight both the current efforts toward greater flow as well as opportunities for collaboration.

1. One major issue is the serious shortage of information on books and where to find them available to children's book mediators (parents, teachers, librarians, animators). In the specific case of teachers, most of them do not receive a solid knowledge of Arabic children's literature, its importance in comprehensive literacy acquisition and innovative literacy strategies in their training (UAE Ministry of Culture, 2020, p. 362). The bridging of this gap becomes all the more critical with an increase in the number of children's books being published which threatens to overwhelm the buyer. As a result, all those who mediate between the book and child can benefit from information not only about new titles but about their quality, pedagogic and esthetic value, and suitability. This can be achieved through accessible resource centers, book lists, bibliographies, reading and activity guides as well as capacity building opportunities for book mediators. In the past, the IBBY National Sections in Egypt and Lebanon have produced some valuable book lists but not in a systematic or regular manner. The last comprehensive bibliography of Arabic children's books across the entirety of the Arab region was *ad-Daleel al-Bibliographi li-Kitaab at-Tifl al-'Arabi* (*The Bibliographical Guide to Arab Children's Books*) compiled by Faisal Hajji and which covers the years 1950–1998 (Hajji, 1990, 1995, 1999). Additionally, Bloomsbury Qatar published *The Golden Guide to Children's Books* in 2015 (Abed, 2015). Most recently, Dalil alqira'a alilajiya (*Bibliotherapy guide*) published by the UAE Board on Books for Young People also provides valuable bibliographic information (Mohamed, 2021).
2. In the same vein, a key issue is the lack of strong cooperative links between civil society initiatives and schools, particularly government or public schools. This is often due to the bureaucracy associated with gaining entry into these classrooms, the lack of resources to build and sustain these links, and the reliance of many of these initiatives on volunteers.
3. Organizations that manage children's book prizes should aim for a more direct relationship with schools and children. In addition to recognizing the work of authors, illustrators and publishers, prizes should also seek to promote reading among children. We take the positive examples of the Stichting Lezen Prize (the Netherlands), Le Prix des Incorruptibles (France) and the shadow Carnegie and Kate Greenaway Awards (the UK) in which those who decide on prize winners are children and young people. In the case of Stichting Lezen Prize (the Netherlands), meetings are also held between the child jurors and authors and illustrators while an extensive school cooperation is sought in order to ensure that the shortlisted works for the Carnegie Greenaway medals are read and discussed by children. There is a similar promising, and replicable Arab initiative, the Kitabi Award organized by the Arab Thought Foundation. Works are shortlisted by a selection committee for three age groups and two categories (fiction and nonfiction) and then read by children who ultimately decide the winners.
4. There is a further need to bridge the gap between the academy and practitioners as well as between academic disciplines. There is a disconnect between academics producing scholarly work on children's literature and literacy, on the one hand, and authors and teachers on the other hand. Children's literature needs to be an integral part of courses for practitioners that work with children, from child psychologists to teachers to mediators, while academics have much to learn from the practical experiences of those who have direct contact with children. In addition, scholars working in one field do not always cooperate with those in other fields, sadly reminiscent of the divide between book and child people observed by John Rowe Townsend over 40 years ago (1980, 199). For example, book critics often make generalizations about the child reader, their psychological needs and linguistic or cognitive abilities, but these pronouncements are rarely fortified by updated and context-specific data. For many authors, information about the developmental and linguistic abilities of children would be highly useful.
5. There is a need for more research on all aspects of children's literature and reading. In particular, we advocate for more empirical research on how picture books are used by teachers, librarians, and other mediators and how they are received by children, as very little is known about reception esthetics or impact. Ideally, such empirical research would be participatory in order to make up for the lack of tradition or support for practitioner enquiry, i.e. practitioners carrying out research on their practice to inform their work. Furthermore, an important link can be forged in the ecosystem if this research can be used to inform national scale educational policy. However, this research would be without value if it were not easily accessible. This is a major issue in Arab countries as much of the research coming out of the schools of education is archived in non-digital repositories and does not feed into academic research. In recent years, the Shamaa Arab Educational Information Network archives educational research, but theses, dissertations, and other resources are listed but not digitally accessible. The difficulties of archival research are bureaucratic in Egypt, while archives in countries such as Lebanon Iraq, and Palestine have been reduced by past or current destruction or looting (Byrne, 2020).
6. Children's authors and illustrators are perhaps the most vital actors in this ecosystem, but they may also be the least supported. This is especially the case of new writing and illustrating talent who are often self-taught and seek feedback through informal or online networks, since training courses, where they exist, are sporadic and brief. This results in work that is sometimes mediocre, derivative, and lacking in local identity, especially in the case of up and coming illustrators. To address this, there is a need for more long-term training courses, including specialized university programs as well as systems that incentivize and create opportunities for official and unofficial mentorship relationships between members of different generations of creators. Such relationships are less likely to grow organically as it is virtually impossible for a children's book illustrator or author to make a living wage solely from their work, and the income they make from public appearances, school visits, brief consultancies, and creative writing workshops is often negligible or non-existent hence the unlikelihood of them setting aside to do potentially monetized work for free. Nevertheless, it is important to acknowledge the role being played by prominent, prize-winning illustrators such as Raouf Karray, Hassan Zahreddine, and Maya Fidawi to nurture a new generation, either through teaching at universities or offering workshops.

7. Parental lack of interest in promoting any reading outside of what can directly advance academic achievement (Gregory et al., 2021, 26–27), and the fact that public libraries are not central to the lives of most children, poses challenges in promoting a reading culture in the Arab world. Again, the revival and multiplication of the multimodal library as a community hub, with trained book mediators can change the public perception of the utility of reading, as well as offset many social ills.
8. It is important to note that while Arabic and its various regional dialects are the dominant native languages in Arab countries, the Arab world hosts a large number of minority languages. Some of these minority languages (or rather specific sub-languages), such as Sorani Kurdish (Iraq), Tamazight (Algeria), and Armenian (Lebanon) have achieved the status of official languages in certain countries, but this is not the case of other languages, such as Nubian in Egypt. There is some production of children's literature in minority languages, whether these books are originally written in these languages or made available in them through translation. For example, many Algerian children's books would be available in Tamazight, while Kotot publishers in Lebanon publish Armenian children's literature. Nevertheless, this is an area of Arab publishing that bears developing.

Inside the book

After discussing issues related to the publishing, distribution, promotion, mediation and research on Arabic picture books, we turn to examine the Arabic picture book itself and its content. In particular, we will focus on language, an aspect that provokes more debate than any other in Arabic children's literature; rhyme and poetry as esthetic elements whose pedagogical uses require more attention; and illustration and type.

Language

In addition to the esthetic pleasures they afford, picture books are often considered for the role they may play in promoting literacy at the level of teaching letter and word recognition, building vocabulary, and developing the abilities of children to both comprehend and compose "correct" spoken and written texts. In the case of Arabic picture books, the discussions over this role take place against the backdrop of other ideological discussions related to the diglossic nature of the Arabic language.

To use the term popularized by the American linguist Charles Ferguson (1959), Arabic is a diglossic language in that there is great divergence between the standard written language and spoken dialects, which in themselves differ from one country and region to another. This divergence is significantly wider than that which exists in other languages such as English, and is mostly at the level of grammatical structure and vocabulary. In terms of vocabulary, there is, on one hand, great overlap with words that are either identical or very similar both phonetically and lexically between the written and colloquial varieties, but with equally significant differences (USAID, 2019, 10–12). These overlaps and differences are not stable, but shift depending on the Arabic dialect in question, and even written output in Standard Arabic is often peppered with word choices and expressions that reveal the nationality of the author.

In the oft-reprinted article "Living in Arabic", Edward Said observes that the "educated [Arab] person has two quite distinct linguistic personae in the mother-tongue" and describes his own linguistic path between the colloquial and Standard Arabic. He recognizes the difficulty of mapping the complexity of the relationship between the two tongues and "the way the language is lived in, deployed, and experienced by native speakers and users" onto a Western context (2004). For the most part, Arab children growing up in an Arab country will only begin to be exposed to Standard Arabic in a concentrated manner in school, unless they are also undergoing religious instruction entirely in Standard Arabic. In addition, Standard Arabic is the only language variety acknowledged in educational curricula. It is for this reason that children's books are considered primarily pedagogical tools to teach literacy, and there is some research evidence that reading children's literature helps children make the transition from colloquial to Standard Arabic (Gregory et al., 2021, 26). Arab children growing up in non-Arab countries do not have the same access to or instruction in Standard Arabic, and pick the dialect up passively from their families and possible communities.

Given this diglossic situation as well as the changes that Standard Arabic has undergone over centuries, authors and publishers have choices to make regarding the register or language level they write or publish in as well as in the incorporation (or not) of colloquial words or expressions. In this case, language ideologies figure in an important way. Mathilde Chèvre (2016) noted that children's authors had different viewpoints regarding the "proper" language to use in children's books and identified two main orientations. Some authors opt for an elevated and sometimes challenging language, the mastery of which allows the child to access Arab literary, religious, and historical heritage; others prioritize the promotion of reading for pleasure and favor a more accessible language that can act as a bridge between the spoken and the written.

Nowhere is the debate over language more ideologically fraught than when it comes to the use of or authorship of children's works in a colloquial variety. These disagreements are connected to wider debates over national as well as literary languages that go back for centuries and continue to flare up periodically (Al Jahiz in 800; Osman Sabri and Louis Awad in 1960s, Tawfiq al-Hakim in 1990s, Madiha Doss and Sohair Soukkary in 2000s). Since the start of the twentieth century, these debates have been shaped by attempts to define national identity, especially in times of political unrest or transition. The tension between a pan Arabist political orientation and political movements that emphasize a nation's singularity and separateness, and more recently, globalization and associated fears of cultural attrition and Western cultural imperialism, all have bearings on this discussion.

Given the current state of publishing and education in the Arab world, the sole use of Standard Arabic in children's books is certainly the more expedient choice. Arab Ministries of Education often show serious intolerance to the appearance of colloquial words and expressions in textbooks and children's books. In addition, most publishers also limit themselves to Standard Arabic, not only because schools are their major market but because this allows books to be more versatile, and to sell well in various parts of the Arab region.

While it is not unusual for authors or publishers producing works in colloquial dialects to be criticized, there have been some initiatives to produce books written completely in colloquial Arabic by Arab writers based both inside and outside the Arab world. Those in the diaspora are mainly responding to the absence of books accessible to their own children, whom they wish to be able to understand and communicate in a spoken colloquial but are not necessarily training to read Standard Arabic in the future. Examples of these are the US-based Qossas Stories, a publishing house established by the Palestinian journalist Rym Makhoul and her husband, who have published two books, each made available in the Levantine (spoken in countries such as Lebanon, Syria, Jordan and Palestine in the Western Mediterranean) and Egyptian dialects with the hope of expanding into other dialects. *Kan Ya Makan* (2020) by Riham Al-Shendy is also a well publicized self-published collection of well-known fairy tales retold in rhyme in the Egyptian dialect. The stories have also been "Egyptianized", with each tale set in a different part of the country and incorporating elements of local culture. Shendy has since published two picturebooks also in the Egyptian dialect while in 2021, the publishing house Liblib was launched with the aim of publishing children's literature in various Arabic dialects.

Given how heated the discussion between including (or writing completely in) and excluding colloquial young children's picture books can be, it is ironic that those on different sides of this linguistic debate both appear to consider diglossia as a problem to be solved or a zero sum game. We adopt a different position and view diglossia, differences in national dialects as well as the register within Standard Arabic as a resource and a site of possibility and experimentation. The "distinct" linguistic personae to which Said refers do not have to be in conflict. In addition, it is important to avoid simplistic, often false, binary thinking concerning these two language varieties, with Standard Arabic seen as beautiful but also difficult and potentially alienating while colloquial varieties are seen as more accessible and likely to appeal to children, but less eloquent and pedagogically valuable. Finally, there is the need to respect and accommodate the diverse abilities of children. Further understanding of these issues requires large scale studies as well as the accumulation of small scale studies across contexts and with different groups of children, in addition to the studies that currently exist.

As a result, we advocate moving past this debate in order to raise relevant questions with concrete implications and for multiple strategies to be experimented with and researched. For works primarily or exclusively in Standard Arabic; what choices can be made to balance the need to expand the child's vocabulary and introduce the structure of Standard Arabic in preparation for adult reading with presenting the child with a language that is not excessively distant from the one they use in everyday life or beyond their existing reading competence level? In addition, does the occasional use of colloquial words and expressions lead to Standard Arabic language attrition? What place is there for colloquialisms? A cursory research would reveal many classic works of Arabic literature contain colloquial language or reveal local usage without compromising their classic status.

Those who wish to use colloquial Arabic face a different set of questions. For instance; how does one "transcribe" the colloquial? Should this be done phonetically or should the colloquial be written in a manner similar to Standard Arabic? How does one take into account the diversity within dialects themselves without privileging certain dialects in ways that reproduce class and regional inequalities and stereotypes? In addition, if writing in colloquial language might make a book unmarketable in the larger Arab region, how can the publisher profit from national markets alone? What strategies can publishers adopt if they do not want to limit themselves to local markets? Some strategies that have been used to tackle these operational difficulties include publishing versions in other dialects or Standard Arabic as well as including glossaries at the start of the books such as in Samah Idriss's (2004) *A Boy from Beirut* series. This brings us to another, more ambitious question: how can books feed the Arab child's curiosity about other Arab dialects while remaining hospitable and inclusive?

In addition, it is important to move away from simplistic ways of viewing each language variety. Eloquence is not the sole quality of Standard Arabic but could equally be a feature of colloquial Arabic in much the same way that Standard Arabic can be accessible and playful. In addition, the use of colloquial language is not enough to make a book more appealing. Rather, what distinguishes one book from the other is depth or humor, innovative plots and language use that is audience-aware, and faithful to both the character and the setting.

The debate, too often, centers heavily on comprehensibility rather than the potential of language to esthetically engage the child. Therefore in lieu of asking: can it be understood? We might do well to ask: Does it paint an image? Does it move the child? Does it express the child's voice? Does it expand the child's horizons and perceptions? Does it give the child rich language with which to express the world? How does it fit with other elements of the text or the visual text? In certain books, there is a serious need to align level, subject matter, and form. The quantity of text and language level often exceed the abilities of the target reader of the picture book form it employs, even while the content is childish in some cases. This results in books that are not really likely to be used by mediators, as picture books selected for use with child readers are typically the ones that lie within the range of 500 words. Additionally, the child most likely to select picture books would not have the reading competence to navigate them or feel addressed by their content.

Poetry and rhyme

Arab children have access to poetry and rhyme in a number of texts. The most prominent of these are school textbooks which often include classic poems for children, such as those by Egyptian poet Ahmad Shawqi, or poems originally written for adults considered at the level of theme and language to be appropriate for children. Sometimes, they include original poems composed by textbook compilers, Ministry of Education officials, or poets and writers commissioned to the task. Children's magazines are another venue for poetry, such as *Tuta Tuta* (Lebanon); *Mizmar* (Iraq) and *Samir* (Egypt). In addition, there are a few poetry collections as well as rhymed stories published as standalone picture books. Last, but certainly not least, there are children songs, some of which have become regional classics (for example, the songs of Mohamed Fawzy) to the more modern ones sung by pop stars or actors (Nancy Ajram, Ahmed Helmy) or popularized by Arab satellite channels targeting children.

Some of the features that characterize certain children's poetry that has achieved canonical status is their heavily ideological and didactic nature, with heavy handed nationalistic and religious messaging packaged in an often artless delivery. In addition, they rely on a heavily romantic vision of childhood and repetitive themes, often related to nature, the nation, or the child's everyday life (Al-Safadi, 2008). In terms of language, some questions can also be raised as well in terms of imagery and voice. Many poets do strive to simplify and economize verbiage in their poems, including prominent Syrian poet, Suleiman Issa, as well as other big names such as Mohamed Jamal Amro (Jordan), Haidar Ghazi (Iraq), Jalil Khazaal (Iraq), etc. Given the relative scarcity of new established children's poets, these older poems continue to dominate and represent a useful corpus from which to selectively draw.

Another issue for educators is that the rather scattered manner in which individual poems are published may make them difficult for teachers to find and collect. Poetry collections can begin to address this gap. After the closure of its magazine *Tuta Tuta*, Dar Al-Hadaek started to publish collections of some poems previously published by the magazine, such as those by Jawdat Fakhreddine (Lebanon) and Bayan Safadi (Syria). It is hoped that similar efforts to collect poems originally published in other magazines may materialize. In general, collections of poetry are currently quite rare, and some of the few examples include *Hilm* [A Dream] by Sulafa Hijawi (2009) published by Tamer Institute, Palestine and *Qasr min Al-Rimal* [Sand Castle] by Haidar Ghazi (2012) published by Dar Ashjar, UAE.

In addition, a number of authors are publishing stories in rhyming texts as standalone picture books. However, some of these texts often compromise on musicality and meter, as well as clarity and logic when committing to the use of rhyme in a full length text. Some successful examples of rhymed stories include Alaa Mortada's *Amgad fi Akoun Aw la Akoun* [Amgad in ... To Be or Not To Be] (2018), a humorous tale of the efforts of Amgad, the titular character to find a vocation, often to disastrous ends (Dar Al-Balsam, Egypt) as well as *Daraja Ala Al-Hibaal* [A Bicycle on the Tightrope] (2016) by Elias Zougheib and illustrated by Hatem Fathy Ali, in which a rabbit and a rooster decide to leave the farm where they live to join the circus (Librairie Antoine, Lebanon). Hadil Ghoneim from Egypt uses Standard Arabic that draws from the colloquial lexicon to create the most modern and poetic alphabet book in the new wave 'id Milad' Harf Al-Daad [The Birthday Party of the Letter Daad] (2018). The republishing of some of Mahmoud Darwish's poems not originally intended for children as picture books by Tanmeya Publishing House (Egypt), such as *Fakkir bi-Ghayrak* [Think of Others] (2018) illustrated by Sahar Abdallah, may herald more efforts to repackage and introduce poems by prominent Arab poets to a younger generation. There are also some deliberate attempts to awaken the child's sense of the poetry around them, and encourage them to appreciate the intrinsic esthetic of the poetic Arabic language, and the earth, the seasons, and the sensual as source of inspiration and the emancipation of the imagination, such as the works of the Egyptian poet Mohammad Afifi Matar, whose experimental poetry collection *Catching pigeons* (Sayd al-Yamam) was published posthumously in 2002 by the Department of Culture and Information in Sharjah, the United Arab Emirates (Motawy, 2010).

Poetry and rhyme are under-exploited whether as language acquisition tools, for their ludic potential or as a vehicle for children to see themselves as authors of poetry. Some hoped for future directions in the area of poetry are certainly for more of it to be composed, published, and anthologized. Qualitatively, there is room for it to expand into new themes and away from purely romantic ideas of childhood and cliched images toward integrating the modern, the abstract, and the playful. There are ample opportunities to innovate and experiment at the level of form.

Illustration and type

It is difficult to provide any semblance of an overview of the illustrations in Arabic picture books for the sheer diversity in styles and media, ranging from the closely related to the rich Arabic tradition of visual and calligraphic arts to the clearly anime/manga-inspired, from the hyper-realistic to the more stylized. While some illustrators draw by hand, many others are resorting to digital means and the use of graphic tablets. The artistic backgrounds of illustrators are also diverse. Some come to the field of drawing for children via a training in either the visual arts (as is often the case with Egyptian illustrators such as Ahmed Soliman) or graphic design (the Sudanese Salah Elmur); many are also active in other art forms, such as comics (Lena Mirhij, Ahmed Wahba, Magdy Shafei) or animation (David Habchy) which they then creatively integrate into their work. The recent trend among Arab publishers to work with non-Arab illustrators, primarily from Iran but also from European and South American countries, has made Arabic picture books more globalized in content and visually similar to other international offerings at the expense of a local particularity. While illustrations in children's books have received much less research attention than textual content, exceptions include work by Chèvre (2015), Dinges (2011), Bizri (2011), Al-Zayyat (2011), Batran and Ihshayesh (2011), and Motawy (2021).

In this section, we will focus on one aspect of illustration, type, given the rich heritage of Arabic calligraphy styles. While innovation in traditional Arabic types is enmeshed in tension, the last two decades has seen reasonable experimentation in children's book types. Innovation in children's type and scholarly research on Arabic typography has come from children's book artists as well as academics/artists such as Huda AbiFares, Nadine Chahine, Bahia Shehab, and Mohamed Hassan.

While most picture books selected for scholastic purposes present the core text in traditional fonts, that are equivalent to Arial or Times New Roman, speech/thought bubbles, sounds, front and back matter are often where scripts are played with the most. Some incorporate stylized types that draw attention to the esthetics of Arabic calligraphy itself. Examples include *Waraqat Al-Hayat* [The Paper of Life] (2014) illustrated by Ahmed Soliman and James Rumford's *Silent Music* (2008; 2015) available in an Arabic translation. The type and the rest of the book are most likely to be coherent "iconotexts" when the author/illustrator are the same person, with some iconic handwritten types becoming as recognizable as Quentin Blake's handwriting for instance, such as those developed by the late Mohieddine Labbad (Egypt), Lena Merhej (Lebanon), Raouf Karray (Tunisia) and Walid Taher (Egypt). In some books that revive tradition, or break with it to experiment with the modern, calligraphy is often a character in the text, such as in many of the books published by Dar Onboz in Lebanon and Dar Al-Balsam in Egypt.

As design in children's books is still developing in the Arab world, designers are still finding their place in the ecosystem and the links and lines of communication are still developing between children's publishers and designers. Children's book publishers are also still navigating layout and design. Designers need to understand the specificity of the field, and as Arabic typography research gains momentum, for example through the creation of Typelab at the American University in Cairo in 2020, children's books need to be a part of this research in much the same way as children's illustrators were pioneers in this field.

Type is a clear pedagogical concern for its role in cultivating esthetic appreciation, enabling children to recognize their rich artistic heritage, and directing meaning making in reading. However, experimentation with form should not come at the expense of legibility. The work of Chahine, in particular, addresses accessibility, as her doctoral research tracks children's eye movement in reading Arabic texts to find fixations and saccades in the reading and hypothesize on the impact of complexity of Arabic types on the legibility of text for children. She argues that increased complexity reduces legibility and that the inclusion of short vowels slows reading (see also Gregory et al., 2021, 24 and USAID, 2019, 13–14). Chahine goes on to conclude, "however, the literature review has shown that early exposure to Modern Standard Arabic facilitates the process for children first learning how to read Arabic" (2012, 224). Another issue is that some publishers and designers may choose fonts that require longer fixations to decipher which also slows down the reading process.

Conclusion

We end this section by addressing the move toward the digital in children's books. Some Arab publishing houses, both established and new, such as Kadi and Ramadi, Aliareach, Nahdet Misr, Tuta Tuta and others are transforming picturebooks into digitally enhanced and more interactive ebooks. Other creators such as Lamsa and Bees Studio have produced digital stories that did not originate as books. There is an expansion of potential in the ecosystem and potential links to established Arab adult e-book apps such as Kotobi, Jamaloon, or iKitab as well as those specifically for children's books, such as Kutubee and Noory Books. Without the implementation of more technological and legal barriers to piracy, it is difficult to encourage platforms or other parties to invest in research on optimizing the Arabic picture book as an e-book.

In concluding this overview, our primary overriding recommendation is for greater synchronicity and interconnectedness in the picture book ecosystem. In terms of form, in addition to poetry, there is room for much more writing in the genres, fantasy, science fiction, non-fiction, and new approaches to the ever-popular social realism. Finally, experimentation in language use and type, as well as digitization, would benefit from closer coordination with those conducting participatory research in the Arab world.

Introduction

We open this article by drawing attention to the complicated nature of what we consider literature about African children (LAAC) and/or African children's literature (ACL). Some scholars refer to LAAC or ACL simply as children's literature about Africa (Schmidt, 1981); while others refer to it as African children's literature (Osa, 1985). Nevertheless, Osa (1985) posits, "A true canon of written African children's literature is yet to emerge" (p. 753). We agree with him that African children's literature is a subgenre of African literature that is consistently ignored (Osa, 1985). We would add that the scholarship of LAAC and ACL is also often ignored. For the purpose of this article, we will refer to this genre of literature as ACL while acknowledging that the term can sound generic and all-encompassing—not necessarily capturing the complexity and plurality of stories in ACL. Still, we select this term to align with previous researchers of the field, like Osa (1985).

The terms ACL and LAAC are generic terms educators, librarians, and scholars often use to refer to literature that centers African children's stories, regardless of who is telling/writing the story and the indigenous or colonial languages the author/storyteller chooses to share the story. Oral African children's literature predates its written version, as folklore has existed in Africa for centuries. Thus, we consider this subgenre an authentic African children's literature. The audience for the most part is African peoples including its children. As Osayimwense Osa notes in his introduction to the last issue of the *Journal of African Children's and Youth Literature* (JACYL, 2007–2009—volumes 17 and 18), one of the first journals that focused on ACL,

For generations the people of Black Africa have told stories in their numerous and multitudinous indigenous tongues to children and young people and to adults as well, in their social, informal, or formal gatherings. Storytelling is not a new art for them but one as old as the continent itself (2007/9; p. 1).

He asserts further that: "The present body of African oral tales that have been committed to print are a very insignificant proportion of the total body of folktales on the African continent" (p. 2). However, the issue at stake in this review are the written stories, regardless of the genre. As we begin this review, we ask: For whom are the stories written, and what might be some possible rationale and/or implications for writing these stories as outsiders and for outsiders, as insiders for outsiders, and as outsiders for insiders? Finally, where does this position African children in the continent whose stories are being circulated across the globe?

Advocating for joint conversations and literary criticism that considers African, African American, and Caribbean children's literature, Osa (2007) notes that "Black people in the African diaspora have a common ancestor and a common heritage—Africa before its contact with the outside world and before slavery and its aftermath" (p. 4). In this chapter, we acknowledge essays that focus on these connections but also point out those that highlight the subtle differences that permeate these diverse groups of Black people and how their historical trajectories have contributed to shaping the contents and outcomes of the stories that are published in print or constructed in other modes for consumption by children within our ever-evolving global community. Thus, the "sociocultural connections" (Osa, 2009, p. 4) continue to exist, but diversity in how each Black group navigates space is also apparent and shaped by their unique sociocultural histories as Yenika-Agbaw (2013) demonstrates in "Black Cinderella: Multicultural Literature and School Curriculum."

When it comes to ACL that is published, there are many perspectives through which LAAC and ACL are crafted and distributed. For instance, LAAC and ACL are sometimes written by westerners and published in the west; or published in the continent and marketed to the west, published in the continent and distributed within the continent, or published in the west and reissued in Africa. Some of the scholarship surrounding ACL centers on the issues related to publishing and who is telling these stories. Now that we have provided some background on our perspectives of ACL or LAAC, we will focus on the main issue at hand for this review, scholarship on ACL or LAAC.

Early scholarship, such as anthropologist Schmidt's (1965) ["Children's books about Africa"] and (1975) *Children's books on Africa and their authors: An annotated bibliography*, where surveys of books for children available in the west are discussed, paved the way for serious scholarship on ACL. Schmidt's (1981) ground breaking book, *Children's fiction about Africa in English*, which focuses on fiction, built on this foundation. This body of scholarship was then expanded by other scholars and educators such as Osa (1985, 1987, 1995), Khorana (1994, 1998), MacCann and Maddy (2013, 2008, 1996), Yenika-Agbaw (1996, 2007), 1996) and Yenika-Agbaw and Napoli (2011). Of recent, other scholarly voices have joined the conversation; however, from our perspective, these contributions seem sporadic and, as Thomas (2020) notes, "The outlets of African scholarship in our field are slim [and] [l]ocation [of the scholar also] matters" (p. 11). We find it troubling that scholarly interest in LAAC and ACL seems more about tokenizing LAAC and ACL, and we hope this trend will eventually shift as genuine interest in diverse books for children and young adults continues to flourish.

Sadly, misinformation about Africa seems endemic even in the 21st century, a problem that had caught the attention of several North American Africanists during the mid-nineteenth century. According to Kuntz (1997), one such Africanist and a longtime jury of the Children's African Book Award (CABA) committee, on reviewing the curricula materials on Africa for K-12, a select group of educators noticed that "stereotypes and misinformation" were prevalent (p. 4). This was also confirmed by surveys later conducted in the 1970s by Africanists who observed that:

stereotypes generated in North America and Europe during the 19th and 20th centuries prevailed in textbooks and trade books of pre-collegiate readers. Misinformation about Africa was so pervasive that they had to spend most of their time countering stereotypes rather than administering other outreach services (pp. 3–4).

While there is progress in regard to the overall quality of books about Africa that are being published, stereotypes persist according to the body of scholarship that we read. What follows next is our critical evaluation of existing scholarship on the topic under study.

Critical evaluation of studies and essays/articles surveyed

This critical review discusses empirical and theoretical essays/articles based on studies conducted on African children's literature (ACL) between 1990 and 2020. We chose to focus on these three decades primarily because the 1990s saw the rise in scholarly interest in ACL. Other reasons include the publication of more books about African children and the continent, the emergence of Children's Africana Book Award (CABA) as a prestigious award, in its own right, recognized and housed by African Studies Association (ASA) and heavily supported by Howard University (a prestigious HBCU institution) as part of its outreach program. These decades also encompass the period when the public began seeing the proliferation of independent publishing houses, such as the highly successful Sub-Saharan Publishers in Accra, Ghana, and Lantana in the United Kingdom, that focus on African children's literature. Book fairs across the globe are now sensitive to the exclusion of quality books about Black people. Finally, the We Need Diverse Books movement also drew attention to the lack of books about Blacks more generally, including Black Africans. Thus, the early 21st century heralded an atmosphere of the modern globalization era that boosted transformative practices within the publishing industry and, as such, slowly paved the way for partnerships to blossom between some publishers in the west and those in Africa.

During these decades much has happened to change the landscape of the children's literature field drawing attention to ACL. For instance, the *Journal of African Youth Literature* (JACYL) gained more visibility, *Sankofa: The Journal of African Children's and Young Adult Literature* was launched by Morgan State University with Meena Khorana as the founding editor. An outreach program, Africaaccessreview.org (established by Brenda Randolph a librarian in 1989) gained in popularity as a site where educators could locate books on Africa reviewed by Africanists. Additionally, there now exist more books on the African diaspora that deliberately connect people of African descent with the continent. Because these have become readily available even though in low numbers, they are helping to expand our repertoire of what it means to be Black and African in the 21st century and across the globe.

With all of these exciting initiatives we were hoping that the scholarship on ACL would have evolved in similar ways, privileging voices of Africans both as scholars/researchers and authors in the west and in Africa. Unfortunately, this is not so, as one can deduce from Thomas' (2020) passionate and intellectually invigorating essay on this vexing issue. Thomas rightfully observes, "Black African and African diaspora literature, media and culture for youth and young adults has heretofore been largely out of the hands of scholars of African descent" (Thomas, 2020, p. 3). This therefore begs the question, why? Exploring this question, in her article, Thomas "trace[s] traditions of research and criticism of African diaspora young adult literature in four regions" including Africa, the

continent of interest in this article (p. 3). We are continuing to search for answers by considering research traditions and criticism across what is considered African children's and young adult literature—often lumped together in most of the studies. Thus, the following research questions guide our review:

- What topics seem to be of interest to researchers undertaking empirical studies and/or theoretical research on African children's literature?
- What do the researchers and scholars assert about their observations of how Africans are portrayed and analyzed in the literature?
 - *Sub-question:* How have studies about African children's literature analyzed their depiction in children's books?

Research and literary criticism on African children's literature

Studies and essays were located primarily from searches done in four databases: JSTOR, Google Scholar, Proquest and ERIC. We examined 50 articles/book chapters/books and what we present here is representative of the findings, in which we focus on a select 17 of the articles that encompassed the themes we consistently saw. Some essays first appeared in journals and subsequently as parts of books, for instance, Osa's (1987) "The rise of African children's literature" and Yenika-Agbaw's (1998) "Images of Africa in children's books: Replacing old stereotypes with new ones." We avoided book reviews, commentaries in blogs, and articles that focused on reading materials, such as excerpts for textbooks that serve as curricular materials.

Within the selected essays and book chapters we reviewed, we found a variety of discourses. Our first finding was that African children's literature, whether directly or indirectly, seem to be aligned with and influenced by the colonial experience, values and timeline. In other words, we often observed postcolonial or neocolonial lenses, as influenced by the colonial history of the African contexts. Depending on who is writing, children's literature about Africa is either described as promoting imperialistic, white supremacist values or is instrumental in restoring, reconstructing or reinforcing post-colonial cultural or national identity. This latter task of reconstruction happens in various ways.

The earlier articles such as those by Schmidt and Osa often began with a discussion about the various ways that children's literature is defined. The range of issues under this topic includes: Who is a child? How is childhood defined? Who is writing stories for children (implying adults as the spokesperson)? They also convey an urgency to decolonize the field for it to be truly considered African children's literature but also acknowledge the persistent challenges in this task of decolonization and reconstruction, including limited indigenous voices (creative writers and as scholars), publishing issues, market forces, audience, ideologies of readers and authors.

The representative essays selected for this review cover six major topics as noted below; however, our discussion will revolve around the first four, which we believe are quite pertinent given the realities of the modern global society:

- Annotations of books (Schmidt, 1975, 1981; Khorana, 1994)
- Issues of representations as informed by postcolonial and/or neocolonialism (Osa, 1983—Nigeria; Khorana, 1994, 1998—the continent; Yenika-Agbaw, 2007—west Africa; Yenika-Agbaw and Napoli, 2011—west Africa; Yenika-Agbaw, 2018—the Nso people of Cameroon; Maddy and McCann, 2013—South Africa); Heale and Williams (2013—white South Africans); Representation and environment (Jenkins, 2004); Representation of African cities (Kuntz, 1997);
- Publishing challenges (Osa, 1987, 2010; Joubert, 1991; Nwapa, 1997), and the dynamics of translation (Kruger, 2012); and
- Accessibility issues and the integration of African children's literature in school curriculum across the globe (Osa, 1987).
- Values encountered in African children's books published in the west (Fleishack and Meehan, 2014; Ntuli and Mafela, 2013);
- Quality of African children's literature (Williams and Heale, 2013)

Before we share our observations regarding critical conversations on ACL, we need to confirm our hypothesis of fewer indigenous scholars from the continent participating in these scholarly conversations. We would also like to draw attention to the fact that the bulk of the literary criticism emanates from scholars who are located in South Africa, followed by those in Nigeria. Even including those South African and Nigerian scholars, the contribution of African scholars to the ACL field is still lean, demonstrating the lack of scholarly voices coming from the African continent.

The scholarship of annotations

The scholarship of annotations is a good place to begin since many educators often complain about not being able to locate African children's literature in their local libraries and/or bookstores. Thus, Nancy Schmidt's pioneering book, (1975), *Children's books on Africa and their authors: An annotated bibliography* paved the way for scholars with interest in this topic. In her book, she discusses the kinds of stories that existed in print, focusing on who the authors were. While a good resource at the time, as it got publishers to pay attention, it was limited in scope. Almost two decades later, Khorana's (1994) *Africa in literature for children and young adults: An annotated bibliography of English language books* built on this foundation, expanding the entries to include not only a variety of genres but also an introduction that critically analyzed the overall quality of the books that were accessible to the public. Like Schmidt, Khorana had to canvas the streets looking for books by indigenes that were published in independent bookstores and so were not readily available in mainstream libraries or bookstores.

Representations of Africa in children's literature

By far the largest form of scholarship revolves around the issue of representations.

As early as 1981, when Schmidt's groundbreaking book caught the public's attention was published, it was already clear that biases existed in books that attempted to portray Africa and her children. In her book, instead of focusing on the authors as she did in the earlier annotation, she adopted a more critical lens, albeit from her anthropological perspective, pointing out the discrepancies in the way African characters were portrayed in the books around specific themes. Osa (1983) remarks in his review of Schmidt's 1981 book,

Schmidt identified a related problem inherent in the study of juvenile and other literature of Africa. The bibliographic task here is formidable, she points out, since the literature is written in many languages in Europe and in Africa... By thematically comparing and contrasting fiction written for Euro-American children with that written for African children, Schmidt shows that biases about Africa are more predominant in Euro-American books (p. 259).

This is how endemic stereotypes about Africa are. One would imagine that things would have improved years later after Khorana's annotated bibliography (1994) was published, but it wasn't so as her next book, *Critical perspectives on postcolonial African children's and young adult Literature* published in 1998 would demonstrate.

Maddy and McCann (1996) use a neocolonial lens to discuss common stereotypes that are pervasive in books about Africa, pointing that often times these books receive awards despite the misinformation that they spew about the continent and her children. They continue this line of inquiry in their 2008 book, *Neo-Imperialism in children's books about Africa: A study of contemporary fiction*. Situating their analysis within a historical context, they discuss biases in books by well-known western and/or South American authors such as Nancy Farmer and Isabel Allende. In this way they are able to label such practices as racist. In the front matter of their book, they note (referencing Jeffery Richards):

Children's literature is a useful instrument for imperialists as they preserve their faith in their imperial agendas. Stories for the young appear innocent, unconnected with the violence of political and cultural domination. However, these stories are largely improvisations on the Western notions that there exists a White man's burden, a concept reinforced when fictional characters are depicted in children's books as incapable of self-determination. White children absorb this myth easily from educational professionals and see no reason to doubt their own alleged superiority (unpagged).

In this particular book, they analyzed thirteen novels set in various African settings to illustrate their point. Their next book, *Apartheid and Racism in South African Children's Literature: 1985–1995* (2013) examines racism that permeates books for children set in South Africa, arguing that the racist apartheid ideology permeates the literature. All in all, representations of Black Africans remain the focus as it draws attention to injustices that spans decades within South Africa.

Yenika-Agbaw's (1998) "Images of West Africa in children's books: Replacing Old Stereotypes with new ones?" and her *Representing Africa in children's literature: Old and new ways of seeing* (2007), expand the dialog by exploring other forms of representations by outsiders and insiders who continue to denigrate the idea of being Black and African through a post-colonial lens. Focusing on West Africa, she was surprised at the realization that even images by renowned authors such as Cyprian Ekwensi perpetuated the idea of Africa as a jungle and Africans as savage. Her findings further complicated the discourse as it begged the question of who then can tell our children's stories? In her closing chapter, she draws attention to the idea of how colonized education seems to have distorted how west Africans regard themselves. Thus, through whose eyes might these authors be telling the stories, or are they simply practicing the culture of mimicry, which Bhabha (2004) defined as "ironic compromise" that is born of the desire to create a "recognizable Other" that results in a "difference that is almost the same" (p. 122).

Essays on representations do not remain only at the continental level as we have illustrated in the last paragraphs, some often target representations in specific African countries. For instance, Williams and Heale's (2013) further discuss the implications of having early books for South African children that center mainly white children. They postulate (2013), "The adult African in European children's fiction was either portrayed as a 'noble savage' or a 'stupid servant'. Any concept of 'noble' disappeared swiftly after South Africa came under National Unity Party" (p. 88). Other works of criticism that examined the contents of children's or young adult literature set in South Africa include Stadler's (2017) *South African Young adult literature in English: 2000–2014*. In his review of Sadler's book, Ellyn Jenkins remarks that her readings of the twenty-four novels "gives no close textual analysis and makes no judgment" (Jenkins, 2017, p. 118). This makes us wonder why she hesitates to give an opinion, especially since her approach described by herself is a "witness document" (p. 11) even though she utilizes several critical discourses, including postcolonialism.

Also surrounding children's literature in South Africa, Jenkins (2004) discussed the shifting focus of children's literature and conservation. His work was not specifically on representation, but he did discuss the transition of children's literature from featuring a white perspective that viewed Whites as having sole ownership of the land to now including and representing indigenous voices through folktales that represent the Black South African indigenous beliefs and practices in conservation. We see this as representation, as he is discussing the bringing in of an indigenous perspective of conservation and land ownership in children's literature.

In regards to representations of Nigerians, renowned author and publisher, [Nwapa \(1997\)](#), who struggled to cultivate local voices to participate in image production, was often frustrated at the quality of illustrations that appeared in locally produced books for children. This sentiment was also shared by Mabel Segun, considered the “doyen of children’s literature and champion of children’s literature in Nigeria” ([Hurs and Ryder, n.d.](#)). In “The importance of illustrations in children’s books,” (1988) she remarks that “Art can help a young child to discover his own identity and cultural heritage. This is particularly important in countries which have suffered from the effects of colonization and cultural imperialism ... Good illustrations can also help to correct wrong notions” (p. 25). Her remarks remind us of the caricature images of Blacks that were ingrained in earlier textbooks such as the *Oxford English Course Reader Four*. These books were written by colonial masters to teach English in “British Africa.” In the collection, a cumulative tale was accompanied by an illustration of a half-naked man, called Lakayana, holding a spear; hence the title of the tale, “See me Lakayana with my spear.” This image haunted some of Vivian’s (first author’s) childhood friends growing up in Cameroon. Her friends were teased and referred to as Lakayana by other classmates because of their clothing. Segun added that, “Too many Nigerian artists give illustrations unimaginative treatment. Having imbibed stereotypes ideas themselves, they perpetuate these stereotypes in their illustrations” (p. 26).

Another country that is focused on in terms of ACL literary criticism and representations is Ghana. For instance, in their essay, “Children’s literature in Ghana: A survey,” [Yitah and Komasi \(2009\)](#) examine the transition of the subject of children’s literature from colonial to postcolonial times. They conclude that children’s literature during the colonial era did not represent the sociocultural context of the Ghanaian child. During the post-independence period, while books gradually started reflecting some of the socio-cultural contexts, their overall quality remained wanting. This essay, therefore, while addressing issues of representations, also addresses publishing issues in ways similar to Mabel Segun’s on Nigerian representations.

Other essays, such as [Kunz \(1997\)](#), focus on representations of specific aspects of Africa. In her work, Kunz works to counterbalance the notion of Africa as one big rural community by examining the images of cities that prevail in selected books from the Cooperative Children’s Book Center (CCBC) collection at Wisconsin. Her findings confirmed her hypothesis of the prevalence of rural cultures in African children’s literature in relation to urban cultures. [Desai \(2011\)](#) also describes the themes and trends in African children’s literature as predominately related to village life, war and ethnic conflict, echoing some of the Kunz’s concerns on the lack of urban representations. The issue here, of course, is that when stories of war become the common narrative of African countries, people’s perceptions of Africa and African countries becomes one of instability and even barbarianism.

Publishing of books with Black and Brown faces

Why is it important to publish books with Black and Brown faces? Of course, within the field of children’s literature, the call for representation has become increasingly louder, beginning with Rudine Sims [Bishop’s \(1990\)](#) call for children’s books that work as mirrors, windows, and sliding glass doors, so that children can see themselves and other children’s experiences through children’s literature. This takes Vivian (first author) back to one of her earlier studies with her children on Lloyd Alexander and Trina Schart Hyman’s *The Fortune-Tellers*. As Vivian ([Yenika-Agbaw, 1996](#)) noted in the essay,

When my children first saw *The fortune-tellers*, their immediate reaction was, “What kind of book is this?”, Yenik, my then 7-year -old-son began twisting his nose in disgust, then suddenly burst out, “Oh, it’s Africa people!” This aroused their curiosity. Luma, the second son (age 6), grabbed the book quickly and began leafing through its pages. “No, he protested, It’s Cameroon people!” From the illustrations he was able to identify a specific group of people—his people—whose cultural experience he had actually participated in before coming to the United States (p. 28).

If this is not enough reason to publish quality books that are representative of all cultures, then we have a problem. Nevertheless, this continues to be a challenge, as some of the essays posit. In “The growth of African children’s literature,” [Osa \(1987\)](#) observes that translating African “oral narratives into print” can be a challenge, but argues that this challenge should not deter African authors from embarking on this creative journey. To him, “what is needed in Africa today is a concerted continent-wide effort by children’s literature scholars, educators, sociologists, and anthropologists to share their ideas. It is in this spirit of sharing that true interdisciplinary criticism of African children’s literature will slowly but surely emerge” (p. 322). [Yenika-Agbaw \(2007\)](#) also addresses this issue of publishing. Trying to get her children’s book manuscripts published have posed particular challenges. In the continent, one was locating an artist who considers illustrating for children worthwhile. Another is that, in the US, it has been a question of audience. For whom, was she writing? Rejection letters praise her strong sense of place, but do not think they can publish her work (perhaps because of the market forces, she speculates). Therefore, she knows this challenge is real.

While more books for children published in the continent are from South Africa, [Heale’s \(1998\)](#) essay argues that more could be done. He discusses the publishing trends and how this might also influence how children interact with books in “What publishers are publishing and what children want to read.” Since this essay was published, we have seen the emergence of Niki Daly, whose books are extremely popular in South Africa and do also have global appeal, especially his Jamila series—even when they seem to convey stereotypes. In an interview ([2020](#)) with Naomi Valenzuela, an intern at Catalyst press, when Daly was asked why he chose to make his protagonist a “black girl,” Daly replied, “Compared to the street life I could relate to as a child I found little that

interested me in the subdued streets and middle class culture I found myself. So, I turned to the township streets and the lives of the poor and working class to find settings for the stories that I could tell" (unpaged). From a critical stance, many scholars would regard this as cultural appropriation, as it comes across as though he is exploiting the misery of the Black working poor for his own material gain. We could also ask, would his books have been so successful were he Black?

When it comes to representing Brown and Black folks, the publishing industry continues to pose a challenge. Many are seeking creative ways to fill in the gaps in their respective countries, such as the recent success of the Golden Baobab Foundation of Education, started by Deborah Ahenkorah, who launched the Golden Baobab prize in 2016 to encourage local publishing in Ghana and the continent. A clever tweet from the Global Centre for Pluralism, which Deborah Ahenkorah retweeted on February 14, 2020, touches on the complex nature of racism and children's literature. It reads, "Imagine if Anne of Green Gables lived not in Avonlea P.E.I but in Harare, Zimbabwe, would she have become the household name she is today?" This tweet echoes several nuances about the publishing experience, highlighting race and geographical location as pivotal to the success of a story. The challenges that Osa (1987) identified several decades ago remain—continuing the need for market forces and inclusive voices that allow Africans to tell their stories, review these stories, and critique them according to their own research traditions.

Joubert (1991) describes the inequities of the dominant publishing model in South Africa which is mainly driven by profit and serves the minority white population. She advocates a budding alternative that is both ideologically and economically efficient and will attend to the literacy needs of the "other" South Africa that has been marginalized by the current industry. Traditional publishers are capable of this alternative equitable publishing under the right circumstances, as is educational publishing. Due to its segregated origins, there exists a black majority in the school system whose required textbook demands are met by these same conventional publishers. The true distribution of the population should be represented in the objectives of the entire publishing industry.

Essays on publishing in Kenya reveal other concerns. While Muringi (2014) attests to the existence of books in indigenous languages, his focus in "Transformations in Kenyan's Children's Prose" is on the social evolution of the publishing landscape vis à vis the evolution of the country itself. Like the other scholars, he opens with references to the lament of the dearth of books with local flavor. He then acknowledges that since research done by his predecessors, the children's literature landscape has gradually evolved. The entire article chronicles this development from a historical perspective starting from 1966 through 2008. After discussing ten carefully selected books, he concludes that the books portray a variety of representations reflecting their colonial, post-independence and postcolonial histories. Thus, to him, "as the Kenyan society changes, so does its children's literature" (p. 97). The essay, while implying publishing struggles, does not overtly address this, as the primary focus was on the evolution of the children's literature as a cultural artifact that is shaped by its cultural surroundings.

Accessibility issues

Accessibility issues continue to be a major challenge despite the numerous international book fairs, including the Ghanaian book fair that occurs in Africa. Vivian (first author) was privileged to have attended the book fair in Accra in 2019 as part of her role with the International Board on Books for Young people (IBBY). While she totally enjoyed the experience, she was also saddened at the overall quality of books on display. Leafing through some, the concerns that Nwapa (1997) and Segun (1988/2015) expressed continue to manifest. However, all is not lost as there are a few publishing houses such as the Sub Saharan Publishers, whose quality titles are rising to the top. With local illustrators stepping up to deliver, this publisher seems to be the hope for Ghana and most of English-speaking Africa, but accessibility issues remain, as it is difficult to get these quality titles outside of Africa. This is where Brenda Randolph's Africa Access organization steps in, forming a great partnership with authors/illustrators and publishers in Africa whose work the organization promotes in the United States.

In a YouTube conversation of their work, Brenda Randolph (Africa Access Outreach Director at the Center for African Studies at Howard University), and Dorcas Wepukhulu (Eastern and Western Africa Kenya-based Partner Development Coordinator at African Storybook), discussed the impact and evolution of African children's literature from the use of racist images through recycled images to more authentic narratives, like *Galimoto*. Of specific mention is the crop of second generation African American writers born in America, creating literature for American youth that is faithful to their parent's African heritage.

The seminar discussed online resources (www.africaaccessreview.org and www.africanstorybook.org) for finding and using African's children's literature, and the collaboration happening between teachers, libraries, authors, and publishers working together to provide constructive learning environments for students in both US and Africa. Africa Access, based in the United States, has extensive partnerships with Howard University, local libraries etc. in the sponsorship of the CABA awards among other initiatives.

African Storybook is an openly licensed digital publication endeavor based in South Africa. It was started as a response to the dearth of storybooks in Sub Saharan African languages by providing digital stories for individual, schools, or libraries to directly print and use. Users can also upload their own stories, translate existing stories or adapt provided images to create their own stories. Their goal is for knowledge and stories to be (multilingually) created and shared in the sub-Saharan community and beyond.

As a professional who has actively participated in selecting books for CABA awards, and who has represented Brenda Randolph at conferences or presented side-by-side her and Meena Khorana, the founding editor of *Sankofa*, Vivian can testify as to the tireless work that goes into seeking ways to publicize African children's literature globally and locally. With Vanessa Oyugi, a new outreach director now working closely with Brenda Randolph, the hope is that many more teachers, librarians, educators would even become more aware of this initiative.

While the work of the Africa Access Outreach largely opens doors of access between Africa and the US, similar efforts are being made elsewhere through individual partnerships. For example, Deborah Ahenkorah at Golden Baobab and Sarah Odedina, an editor for Pushkin Children's Books in the UK have teamed up to bring books created by African authors and illustrators to the UK. They work together, as Pushkin Children's Books, under the direction of Odedina, works to publish select titles from Ahenkorah's African Bureau Stories. Still, more efforts need to be made to create access to children's books coming from the African continent.

Now that we have taken time to unpack representation, publishing, and accessibility issues, we can say that there now seems to be a heightened awareness of this gross injustice within the fields of children's literature. In response, an international journal of the International Research Society for Children's Literature has created a section for African children's literature in their highly regarded journal, *International Research in Children's Literature*. Even *Children's Literature in Education*, which many of us consider extremely resistant to diverse voices, is stepping up to include pieces on Black children's literature. These are all baby steps and we hope that more will be done when it comes to including critical voices on African children's literature.

Gaps in the scholarship

We started off with two primary purposes for our review: to understand the kinds of studies that researchers are conducting or have conducted in regards to children's literatures about Africa; and to understand who the researchers behind these studies are. Overall, our findings reveal that the majority of the studies focused on representations and authenticity, and are grounded in postcolonial and neocolonial theories, shaped by anthropological and "witness" approaches and informed by general literary criticism guided by textual analysis.

As one can see, because of the endemic exclusion of Black African critical voices, research traditions and/or discourses in the conversation on the few books that are being published and hopefully read, include a heavy emphasis on representational issues. While this issue remains pivotal as we forge forward as a community, there are other areas that could benefit from more research. Some of these include:

- Literacies around books published and used in the continent;
- African children's responses to books published in their local settings;
- Dialog on the state of multilingual publishing of African CL in the continent and the market forces;
- African children as authors;
- African diaspora and African protagonists who navigate both spaces;
- Building of equitable partnerships with other stakeholders within the continent and across the globe. What makes these partnerships equitable or not?
- ACL scholarship from or about the other African subregions apart from South Africa, which seems to produce relatively higher amount of works.

We need to reiterate that this is not an exhaustive study; it is just a sample of the types of research and literary criticism on ACL that are currently available based on the four databases we researched. We would have liked to include critical pieces on African diasporan stories that feature African protagonists who shuttle back and forth between the continent and the diaspora, but we could not find much on this. As we conclude our chapter, we hope the landscape of African children's literature will improve to reflect the complex diversity within the continent and among its children including those who call the diaspora and Africa home. We look forward to more studies that critically examine this diversity. The current climate in the country demands that we educate ourselves on issues of otherness and how our perspectives on this might shape how we navigate texts about the other and make space within our scholarly and educational platforms for healthy conversations that enable us to better understand one another. But we must continue to study the books that are published locally, nationally, and globally by insiders, in-betweens, and outsiders.

Introduction

Global meaning-making emanates from the view that there are important local and global issues that demand our consideration. These issues are tied to human rights concerns as they relate to social, cultural, economic, and health matters, as well as to the natural world. They pertain to matters of equity and discrimination, opportunity and access, responsibility and respect, and sustainability and health. The notion of global meaning-making supports responses to these issues that wed critical engagement with socio-political analyses and advocacy—enlisting understandings of globalism, multiculturalism, postcolonialism, and diversity (especially with regard to issues of race, indigeneity, and migrations). More broadly, it entails those socio-cultural views of meaning-making and critical theoretical and sociological interrogations of society (especially postcolonialism) that rose toward the turn of the last century.

At the local level, global meaning-making responses relate to [Ladson-Billings' \(1994\)](#) quest for “culturally relevant schools that ... provide educational self-determination, (and) honor and respect the student's home culture” (pp. 135–137). They are tied to notions of the cultured learner and teacher emanating from Canada (see the Québec Charter; [Ministère de l'Éducation, 2001](#)). As [Paré \(2004\)](#) suggested, “the cultured teacher is ... a broker who establishes links between students and the world” (p. 3). The tools employed in such a process similarly resonate with scholars of multiculturalism (especially translanguaging), who argue that all meaning-makers are multilingual as they enlist their ever-expanding repertoires of experiences to understand and contemplate meanings ([García and Kleifgen, 2020](#); [Gee, 2001](#); [Gutiérrez et al., 2009](#); [Lee, 2020](#); [NASEM, 2018](#); [Purcell-Gates, 2006](#)).

Befitting forms of shuttling back and forth been the local and wider world, global meaning-making also weaves together notions of cosmopolitanism (e.g., what has been described as public diplomacy) with a disposition toward respect for cultural diversity ([Hull and Stornaiuolo, 2014](#); [Stornaiuolo and Nichols, 2019](#)). As with [Rizvi's \(2009b\)](#) discussion of cosmopolitanism, global meaning-making is “a political philosophy, a moral theory and a cultural disposition” (p. 253). It is, as [Nussbaum \(1997\)](#) has suggested, a process of critical reflection and reflexivity—one that identifies with the global human community and engages one's ability to imagine across cultural differences. As [Luke \(2004\)](#) explained, this involves:

... exploring the conditions for intercultural and global intersubjectivity ... an engagement in globalized analyses that continually situate and resituate learners ... their local conditions, social relations and communities, in critical analyses of the directions, impacts and consequences of global flows of capital, bodies, and discourse (pp. 1438–1439, 1441).

Such work is consistent with advocates of local cultural expectations, as seen in [Giddens \(1999\)](#), who argues for a global dialectic, or [Park \(2017\)](#), who espouses “a paradigm shift ... with a de-imperialized, de-colonized, and de-Cold War mentality” (p. 760). As [Soysal \(1994\)](#) has argued:

The state is no longer an autonomous and independent organization closed over a nationally defined population. Instead, we have a system of constitutionally interconnected states with a multiplicity of membership. [Hence] ... the logic of personhood supersedes the logic of national

citizenship, [and] individual rights and obligations, which were historically located in the nation-state, have increasingly moved to a universalistic plane, transcending the boundaries of national states (pp. 164–165).

The commitment to the importance of diversity is consistent with the view of the world as pluralistic—comprised of coexisting, criss-crossing spaces with multicultural and multilingual aspirations as well as ecological goals (de Sousa Santos, 2007a,b, 2013; de Sousa Santos et al., 2007; Grigorov and Fleuri, 2012; Misiaszek, 2015).

Global meaning-making thus aligns with calls for responsive, ethical and proactive engagements with the socio-politics of planetary considerations (e.g., Abdi, 2015; Andreotti and de Sousa, 2011; Misiaszek, 2015; Torres, 2015). Accordingly, critical analysis and advocacy are seen as integral to global meaning-making—especially pursuits that espouse postcolonial ethical stances (e.g., Smith, 2005) and the liberatory educational aims of Freire (1973) and Boal (1993) to go beyond reading the *word* to reading the *world*. This is exemplified by the ongoing Indigenous concerns raised and activism pursued by First Nations, Maori, and Australian Aboriginal educators in New Zealand, Australia, and Canada, which honor and respect Aboriginal ways of knowing and languages (e.g., Battiste, 1998; Battiste and Henderson, 2000; Bishop, 1994; Nakata, 2001, 2004; Ocholla, 2007; Rigney and Hattam, 2018; Smith, 2000, 2015, 1999; Woods and Biermann, 2009). It is consistent with the design principles proposed by Gutiérrez (2011, 2016) for ecologically resistant and culture accommodating research that include the following:

(a) deep attention to history and historicity, including how they relate to resilience, sustainability, and equity; (b) a focus on re-mediating activity, that is, a focus on reorganizing the functional system rather than individuals; (c) employing a dynamic model of culture with an understanding that cultural and other forms of diversity are key resources for sustainability; (d) a persistent emphasis on equity across the design process in the theorization, design, and implementation; (e) an emphasis on resilience and change, where change implicates the individual, the collective, and the ecology; and (f) an end goal of transformation and sustainability.

Gutiérrez (2016, p. 192).

Dimensions of global meaning-making: key processes

Global meaning-making aligns with pursuits valuing heterogeneity over homogeneity; accommodation over assimilation; and contextually bound engagements over broad generalized prescriptions. These values are ensued as meaning makers engage with:

- Addressing pressing local and global issues;
- Interrupting existing frames, especially cultural hegemony;
- Decolonizing and opening spaces for the sovereignty of and respect for diverse cultures and their self-determination;
- Accommodating cultural dynamics within and across communities—via adaptation, translanguaging, fusion, and border-crossing;
- Reading self and deconstructing identity as one engages with diversity, indigeneity, and decolonization;
- Being mindful, and finding a higher moral plane;
- Interrogating truth/post-truth;
- Being activist or actionist.

Tierney (2018a,b).

Forms of participation may shift as meaning-makers traverse multiple public spheres, identities, and approaches in their contemplations, analyzes, and responses. As individuals contend with various cultures, this process may align with context-specific negotiations or navigations of cross-border meaning-making (e.g., García and Kleifgen, 2020; Horowitz, 2012; Nelson et al., 2016). This may involve “... an instantiation of boundary crossing where an individual deliberately and consciously pushes against society’s ideological constraints” (Gutiérrez et al., 2017, p. 53). Singularly or collectively, it may entail forms of consultation and leveraging as meaning-makers negotiate the norms of societies and communities—in respectful ways that do not defy or defile, unless intended to disrupt the systems antithetical to the pursuits themselves.

Undeniably, certain kinds of shuttle diplomacy are complex, especially as meaning-makers themselves engage in or affiliate with movements of social transformation as activists, allies, or cultural development workers (Bishop, 1994, 2009; Butler, 2011; Campano et al., 2010; San Pedro, 2018). Challenges to the dominant cultural interests will be ill-fated unless meaning-makers approach matters reservedly as they engage with and seek to shift the socio-political currents that they encounter.

Global meaning-making requires responding to local concerns with an eye to both local considerations and global matters. Global meaning-making can therefore take on diverse forms, move in different directions that stem from multiple perspectives, different interpretations and are shaped by various forms of reconciliation arise (e.g., in cases where intra- and intercultural developments and differences, and parsimony between local and global communities, are negotiated).

Fig. 1 Dimensions of global meaning-making.

Under the umbrellas of contemplation, analysis, and advocacy, **Fig. 1** attempts to capture the intersecting and iterative nature of global meaning-making—and how they interface with one another. As suggested the clusters entail:

- Adopting a contemplative countenance and probing positioning via socio-political currents, including observing, listening, interrogating, and enlisting multiple perspectives;
- Analyzing how people, events, and issues are represented and positioned by authors and audiences, and how their responses and perceptions enlist multiple perspectives and repertoires of experiences (including multilingualism and rhetorical analyses to discern socio-political matters and possibilities);
- Acting upon deliberations of discernments as one enlists forms of ethical, respectful, and responsive social consciousness as an advocate, activist, and ally.

Befittingly, global meaning-making is diverse rather than predetermined. Its dimensions are more intertwined than discrete, and more recursive than linear.

Sites of contemplation

Befitting this cross-cultural deliberation model, global meaning-making requires contemplation based upon investigations of global and local meanings in terms of their antecedents and constitutions—especially their historical, cultural, and ecological relevance to sociopolitical considerations. As global scholar and comparative educator, [Hayhoe \(2021\)](#) has suggested, cross-cultural deliberations are prompting individuals to adopt a “listening intellect” to engage with the significance of developments on a deeper level—“requiring us to open our minds and hearts to the other” (p. 13). And, as Hayhoe and others have contended (e.g., [Andreotti and de Sousa, 2011](#); [Smith, 1999](#); [Spivak, 1988, 1990](#); [Takayama et al., 2017](#)), being contemplative involves reflexivity, respectfulness, and self-consciousness; it requires staying attuned to what is presented, by whom to whom, and why, when, and where. It also requires an awareness of the intentions and possible effects of various meanings. It likewise demands forms of shuttle diplomacy as one delves into the worlds of others while remaining conscious of the intrusion of one’s own history and its potentially skewed perceptions. Global meaning-makers are not just seeking to understand or present themselves. They are examining ideas in terms of the various subtexts that they might represent or advance.

The basis for contemplations can be quite varied and mixed. They might be spurred by momentary reflections—regarding everyday self-monitoring, incidental exchanges, or news releases—or they can involve extended considerations of an issue or an event in chat rooms, in the media, or across other venues. They may emerge from conversations with friends, family, or community members; they may be derived from “across the aisle” exchanges with strangers or those previously identified as outsiders (e.g., from other cultures or opposing points of view). They might arise in different spaces and experienced as proximate or firsthand, distant or through secondary accounts, or a combination thereof. Oftentimes they reflect our everyday literacies as meaning-makers view or encounter various forms of media (e.g., films, television, news media, social media or websites). They might stem from events that are experienced or witnessed such as incursions between individuals, groups, communities or nations.

Nowadays many of our lives exist across multiple time zones with different communities. We engage in global exchanges on the condition of our worlds especially as we experience the events occurring. Sometimes these events are spurred by natural disasters or political upheaval or forms of terrorism; at other times they may be spurred by efforts to engage with or learn from one another, to aid or to join together in partnerships around regional or planetary concerns. Some might be based in global charters and declarations by global organizations such as the United Nations; others might stem from movements tied to human rights or environmental concerns. Certainly, a number stem from natural disasters such as earthquakes, droughts, hurricanes. Others involve

inequitable treatments such as women have experienced especially in terms of their education (United Nations (UN) Human Rights Council, 2017; United Nations Educational Social Cultural Organization (UNESCO), 2014; UNESCO, 2015a; UN Girls Education Initiative, 2017).

Take, if you will, the various forms of global meaning-making that have arisen recently with the events experienced in Europe. For example, within and across the various sectors of the world, Russia's invasion of Ukraine has led to intense contemplations, analyses and acts amid global considerations of democracy versus autocracy, sovereignty and self-determination together with analyses of motives and actions, responsibilities and ethics. Many of us have been a mix of witness and participant as we have engaged in forms of global meaning-making with these events.

Oftentimes we experience events as they unfold from global sports to acts of terrorism. Such was the case for those of us who grappled with the global news of the Australian white supremacist who killed some 51 Muslim worshipers at two mosques in Christchurch in 2019. The event brought to the surface a range of existing and longstanding issues and debates, including concerns over global terrorism and the rising white supremacist movement; the consequences of interconnectedness with global media; and the precipitousness of hate speech across tweets, blogs and political policy speeches (e.g., as disseminated by online figures from Pewdiepie to Donald Trump). Among the most poignant moments following the attacks occurred with the comments of New Zealand Prime Minister Jacinda Ardern, who reminded her community and the global community at large of the need for a moral compass that embraced each another as one, with all our differences. Her words sharply contrasted with the vitriol and negativity around migration elsewhere in the world. As she stated: "Many of those who would have been directly affected by this shooting may be migrants to New Zealand. They may even be refugees here. They have chosen to make New Zealand their home, and it is their home They are us" (New Zealand Herald, 2019, paras. 3–5).

Similarly, across several countries, especially those involving Indigenous populations, the uncovering of the gravesite of children taken from their families and placed in Residential Schools in Canada spurred global contemplations about the history of assimilation by Church and State (Callimachi, 2021; Tilmouth, 2021; Truth and Reconciliation Commission of Canada, 2015). In Australia particularly, the finding resonated with Australia's atrocious history of assimilation and genocide of Aboriginal populations—still manifested in its systemic discrimination and lack of recognition or respect for Indigenous rights and sovereignty. The events in Canada thus triggered contemplations mixed with analysis and advocacy as they contributed to a greater public reckoning with inequities and racism. For Australians, these stories were educative, provocative, and fueled support for Aboriginal demands for their own transformative change—serving as antecedents to a reconsideration the systemic forces that have shaped the Australian nation and culture, including the unacceptable racism that persists and is perpetuated by the lock that white settler privilege holds over Australian Aboriginal and Torres Strait Islander society.

In Australia, for example, these matters resonate with an awakening of settler society to their miseducation, ignorance and complicity with Australia's racist history. For Australian settlers, several books and movies exposed the history including: Willmott's (1988) *Pemulwuy: The Rainbow Warrior*—the story of Australian Aboriginal resistance to British occupation that was kept invisible to outsiders and across generations of Australian immigrants; Behrendt's (2004) modern day story, *Home*, in which she, an urban Aboriginal, visits her place of heritage in a remote rural area where her community experienced horrific treatment; or movies, such as the 2002 film *Rabbit-Proof Fence*, directed by Phillip Noyce and based upon the 1996 novel *Follow the Rabbit-Proof Fence* by Doris Pilkington Garimara, which follows three girls trying to return to their home following their abduction by government authorities. In Australia, they resonate with the argument presented books challenging misinformation and the faulty understandings of the ways of being of the Australian Aborigines such as Pascoe's (2014) *Dark Emu* (Pascoe, 2014) that described the sophistication of Australian Aboriginal agricultural pursuits or accompanied questioning of the western material terms for judging Aboriginal practices such as the book by Indigenous anthropologists and archeologists, Peter Sutton and Keryn Walshe who challenge Pascoe's measures of development with fuller discussions of Aboriginal life spiritually and ecologically as very advanced hunter-gatherers (Sutton and Walshe, 2021). And, with other commentaries (especially data on education, health, and economics, incarcerations and suicides), add to the need for scrutiny of the hegemonic lock that assimilation, racist and other limiting views holds on Australian society.

There are numerous contemporary texts expressing similarly challenging ideas that call for contemplation and cultural analyses. Take, if you will, *The Poet X* by Acevedo (2018)—a novel in verse examining the struggles of growing up as a Dominican American teenage girl. Or consider the post 9/11 tensions uncovered in *Home is Not a Country* by Safia Elhillo (2021). These are stories involving cultural and intergenerational spaces where authors prompt forms of border crossing. They are stories that readily question socio-political issues and currents, in overt and edgy ways that resonate with the everyday—affording readers opportunities to enlist their translanguaging repertoires of cultural perspectives, languages, and insights as they explore the worlds of diverse populations (e.g., Garcia, 2009; Garcia et al., 2017).

Matters being dealt with these books may be global but are not necessarily foreign. Baldwin's (1974) *If Beale Street Could Talk* moves readers across multiple perspectives, cultures, and worlds. It is a story that engages readers in complex social dynamics within and across families, communities, and cultures. Readers are prompted to actively transact with these cultures, bringing their own selves and their societal experiences into play as they contemplate the events and the cultural forces flowing through the text. And, as Baldwin seems to suggest, Beale Street is not just one place within one story. It represents what for many is a familiar story of differential treatment and injustice tied to race—concerns most recently being confronted by movements such as Black Lives Matter and tied to events such as the death of George Floyd at the hands of police in Minneapolis. Perhaps in tandem with such events, it is a story to contemplate and ponder, and to analyze and act upon.

Analyses

In terms of socio-political analyses, global meaning-making entails adopting different critical frames as vehicles for examining circumstances. Analyses might emanate from close observations of circumstances, or through needs assessments. They might entail examining the rhetoric of politicians and the subtext. Indeed, politicians' speeches and tweets can be sites that lend themselves to various analyses related to how politicians position themselves, key issues, their followers, and their opponents. For instance, in her university course on the use of rhetorical strategy in public discourse, [Mercieca \(2015\)](#), an American political rhetorician and educator, asks students to examine their world news and consider the strategies employed to either advance false storylines/narratives or to pivot away from, rather than confront, core issues. Without accusing news outlets of lies, she has her students screen the array of sources for instances of rhetoric crafted to disguise or override truth, perpetuate certain conspiracies, or sustain narratives that advance insurrection or violent mob behavior. Through this exercise, students engage in rhetorical analyses that address how authors present ideas and consider how audiences are shaped and perhaps coerced into believing and acting in certain ways ([Mercieca, 2015](#); [McMurray, 2021](#)).

The media is replete with analyses focused upon the representation of events, the warrants and evidence of claims being made as well as the motives and politics suggested, implied and verifiable. Consider the focus in recent years on Donald Trump or Vladimir Putin especially the analyses of their speeches and in terms of their goals and their positioning against what is viewed as known and possible agendas. For Donald Trump, it is often aligned with discussions of salespersonship such as Trump espouses in *Trump: The Art of the Deal* ([Trump and Schwartz, 1988](#)) or partisanship, and concern over truthfulness. For both Donald Trump and Vladimir Putin, their representation of history and rationalization of actions are reminiscent of Orwellian discussions of society *Nineteen Eighty-Four*, ([Orwell, 1947](#)) along with the politics ([Orwell, 1984](#)) of language discussed in [Orwell's \(1984\)](#) seminal article, "Politics and the English Language:"

Political language—and with variations this is true of all political parties, from Conservatives to Anarchists—is designed to make lies sound truthful and murder respectable, and to give an appearance of solidity to pure wind (p. 366).

Accordingly, analyses of events can occur at several levels and involve multiple frames and perspectives. Analyses might involve critical examinations of the politics of persuasion, evaluating claims in terms of foundation and evidence. They might entail confronting regressive or insular tendencies of a "post-truth" world ([Peters, 2017](#))—those ideas and rhetorical approaches that advance the suppression of environmental and social developments, or dismiss universal truths through the use of unfettered hyperbole, misrepresentation, oppressive personifications, and false equivalencies. They might address matters of local concern such as social services or individual rights. They might extend the scope to issues of choice and multicultural considerations, such as language use. They might enlist some of the books written in more than one language about cross-cultural engagements (e.g., *My Papi has a Motorcycle*, by Isabel Quintero) to invite and legitimize the multilingual repertoires that meaning-makers bring to explore, imagine, exchange experiences and perspectives, and respond to the issues represented. Such analyses may be spurred by the use of sociological frames (e.g., [Arendt, 1973](#); [Bourdieu, 1993](#); [Connell et al., 2017](#)); rhetorical analyses (e.g., [Burke, 1969](#); [Kubota and Lehner, 2004](#); [Lakoff, 2016](#); [Orwell, 1984](#); [Toulmin, 1958](#)); cross-cultural, critical race, feminisms and gender theory (e.g., [Butler, 2011](#); [Enciso, 1997, 2004](#); [Rogers, 2017](#); [Rogers and Soter, 1997](#)); as well as postmodernism (e.g., [Peters, 2017](#)) to examine how people and ideas are positioned and travel (e.g., [Leander and Sheehy, 2004](#); [Stornaiuolo et al., 2017](#)). Befitting global meaning-making such analyses entail cultural analyses that delve into potential subtexts and socio-cultural-political undercurrents.

Advocacy

Global meaning-making also involves advocacy ranging from local problem-solving to cross-cultural negotiations directed at leveraging. Indeed, the ideological foundation of critical global meaning-making pursuits is tied to pursuing change in ways that support local sustainable efforts or, if necessary, to challenge the hegemonies that advance forms of exceptionalism and privilege. As [Andreotti and de Souza \(2011\)](#) have suggested, there is a need for readers to interrogate ideas, especially in terms of systems. In particular, they suggest readers should be alert to both colonizing constructions of the world (e.g., hegemonic, ethnocentric, ahistorical, depolitic, paternalistic, and simplistic) as well as to their own complicities with the continuation of colonialist systems.

Global meaning-making therefore involves a critical countenance, growing out of a contemplation of and response to the systems at play in ways that advocate for and at times challenge their premises, roles, or influence. Building upon the critical work of [Spivak \(1988, 1990, 1999\)](#), [Andreotti and de Souza \(2011\)](#) call for a global responsiveness and imaginary that disrupts the normative and challenges the colonized status quo. Such work underscores the importance of identifying individual desires as a way to "de-mystify the fantasies behind them and to open up possibilities previously unintelligible to the invested self" ([Andreotti and de Souza, 2011](#), p. 225). As [Stein \(2017a\)](#) has similarly suggested, there is need for a decolonizing orientation,

to interrupt and denaturalize the epistemological and ontological frames of modern existence that are produced through violent and unsustainable relationships and processes— ... to reimagine and recreate what is possible—and to ask about the role of education in facilitating these other possibilities (p. 44).

Inherent to this critical global meaning-making perspective on advocacy is the view that all of us are planetary dwellers with a shared view of human, societal, and planetary rights, along with an interest in the sustainability of our diversity. To share this planet requires an interest in spaces that support cross-cultural engagements—those to which all can bring cultural capital that is distinctive to their meaning-making; where all can actively contribute to a global trajectory built upon support for diversity; where differences without violent intent are respected. Global meaning-making is wedded to decolonizing spaces and knowledge emancipation, where the cultural capital (knowledge and ways of knowing) of various meaning-makers is respected (de Sousa Santos, 2007a).

Global meaning-making involves opening up and supporting the quest for new spaces for contemplation, analysis, and transformation (i.e., of matters pertaining to issues of bias and respect for differences). As Kay (2018) described in his book, *Not Light, but Fire: How to Read Race Conversations in the Classroom*, global meaning-making might be construed as pursuing and opening up new spaces for contemplating complex issues such as racism and prejudice, akin to what have been described as “brave” spaces (Ali, 2017). Such spaces afford meaning-makers opportunities to relate their engagement to people and events within and across worlds—from neighborhood incursions such as shootings by the police, protests, or severed relationships among friends, to more global events. They open up opportunities to share experiences, reflections, and concerns. As translanguaging advocates argue, these spaces advance multiculturalism through pedagogical initiatives that engage meaning-makers’ linguistic and experiential repertoires; expand the community; and challenge the prevailing monolingualistic hegemony within systems (e.g., Garcia et al., 2017).

As advocates and activists, global meaning-makers act as cultural protagonists, siding with local and global diversity, responsibility, and equity against hegemonies that seek to overpower and discriminate. Global meaning-making entails advocating for an accommodation of differences rather than ignoring them. As Haluza-DeLay (2003) asserts: “Knowledge uncovers the oppressive structures and confronts power. However, it is not the ‘knowledge’ alone that does this, but the process by which the knowledge is taken up and used in the community, altering ‘common-sense’” (p. 86). In accordance with activism, global meaning-making involves.

thinking, talking about, researching and theorizing about what is going on, what they are going to do next and how to analyse the situations they face, whether in relation to attending a demonstration, a meeting, a confrontation with institutional forces or planning the next action or campaign.

Kinsman (2006, p. 134).

The activism associated with global meaning-making befits Gramsci’s (1982) view that scholars should be “organic” rather than “traditional intellectuals;” that is, they should engage with the public rather than focus on perpetuating their insular academic theories. This notion is not unlike Freire (1973) conscientização, or transformative change, or what Lather (1986) termed “catalytic”. Moreover, it is consistent with educators engaging in resistance and activism (e.g., Simon and Campano, 2013; Wandera, 2020) and all of us engaging a model of reading and inquiry that aspires to be transformative (Dion et al., 2020). As Goodwin (2012) suggests, it should be “an orientation to inquiry with an obligation to action” (p. 3), involving participation that is tied to local interests and pursued cyclically. Activism is integral to global meaning-making, and the goals of activism are forms of engagement that mobilize communities. As Hall (1978) and Choudry (2015) suggest, activism involves continuously testing, acting on, trying out, and repeating the cycle as one moves forward. It shifts the role of reader from that of a distant observer, critic, or director to a supporter and ally (Bishop, 2009).

Advocacy, activism, and respect entail supporting worlds with fewer walls—campaigning for fewer jurisdictional constraints that often dismiss, censor, or immobilize those who are “othered” within and across communities. Ideally, global meaning-making is not solitary or insular; engagements are participatory and expansive. It involves colleagues and collaborators with knowledges often left out of or overlooked by colonizing Western perspectives, such as those with Indigenous histories, migrant pasts, and cultural moorings from places such as Oceania, Asia, the Americas, and Africa. It seeks spaces that support participatory forms of reading that move beyond contemplation, analyses, understandings and interpretations to responses involving advocacy.

Such advocacy has been exemplified by research projects with youth, involving the use of social media for political purposes (and in conjunction with social movements). For example, Rogers et al. (2015) explored how homeless youth enlist new and critical literacies, especially the multimodal possibilities afforded by various digital media, to engage various publics and themselves in speaking out about societal issues and counter faulty public constructions of their identities. Their projects initiated and described the purposeful enlistment of a mix of genres and forms to foment reflective and responsive engagement, including forms of cultural criticism and civic engagement by youth. As Rogers et al. (2015) describe in their study, young people’s enlistment of digital resources supported “expressions of resistance to the inheritance of the broken promises of democratic citizenship and their ability to imagine new possibilities of public engagement” (p. 2). The youth they observed engaged in “juxtaposing ... hybridizing ... remixing” (p. 102) to create counternarratives and to speak for themselves. As Henry Jenkins and his colleagues describe in their book, *By Any Media Necessary: The New Youth Activism, Connected Youth and Digital Futures* (Jenkins et al., 2016), various innovative forms of youth-led activism demonstrate how young activists’ uses of media and networking might mobilize and engage others in coordinated pursuits that establish points of contact politically, culturally, and institutionally; stimulate the civic imagination; and

explore paths and possibilities in ways that they describe as vertical (from expert to novice, or in terms of institutional hierarchies) or horizontal (peer to peer). As others have suggested the power of forms of symbolic esthetic forms to raise consciousness and engagement in societal issues (e.g., Clover, 2013a,b; Clover and Stalker, 2007).

Border-crossing across multitopic spaces

As implied, being a global meaning-maker entails being multilingual—befitting models of a pluralist world or postmonolingualism (e.g., see Escobar, 2018; Perry, 2020; Perry and Pullanikkatil, 2019; Singh and Lu, 2020; Thiong'o, 1986, 2012). It requires agility and responsiveness, as well as potentially significant forms of accommodations. Such forms of renaturalization, community consultation, and cross-cultural understandings may be less than transparent unless one has language skills and informants (Ndimande, 2018).

As Massey (2005) suggests, spaces for such cross-cultural exchanges require Westerners to look inward and outward, within and across public and private spaces. These spaces operate through intercultural networks (Luke, 2011; Rizvi, 2021), following the bottom-up and sideways flows of people, ideas, and acts (Abdi, 2015; Campano et al., 2010; King, 2017; Tierney, 2017a,b). It may be that “uptakes” occur horizontally or syncretically across sites or boundaries, not unlike the translanguaging that occurs at borders (e.g., Gutiérrez, 2014; Gutiérrez and Rogoff, 2003; Nelson et al., 2016), or the line-stepping, or testing of boundaries, by individuals or groups. As Gutiérrez et al. (2017) describe:

Line-stepping is an instantiation of boundary crossing where an individual deliberately and consciously pushes against society's ideological constraints. Rather than seeing boundaries as static, we recognize their dynamism. By subtly identifying and testing a line, the line-stepper learns how and where lines are permeable and the available latitude in their enforcement. At times, youth will encroach the lines without going over them; at other times, they will cross the lines, attempting to ascertain the severity of the consequences of their boundary crossing (p. 53).

With these global meaning-making crossings and exchanges, there are fusions—in the form of mixing, remixing, adapting, and taking up ideas (e.g., by endorsing, refuting, protesting, or mocking). These may involve artistic renditions, or fusions tied to different epistemologies. With increased access, heightened bandwidth, and a variety of outlets, digital spaces offer global meaning-makers less-regulated venues to assemble, explore, share, and connect. When these fusions are not pursued respectfully, ambitions that are profit-oriented, commodifying, or politically-fueled can override either the diverse interests or the proprietary rights of individuals or communities. The role of the digital in society the power and the significance of digital affordances for global meaning-making should not be underestimated (Deuze et al., 2012; Luke, 2018). These literacies “serve as vehicles to name our worlds, interact with others, imagine, test ideas and change our world. The affordances have become as integral to meaning-making, as air is associated with breathing” (Beach and Tierney, 2016, p. 135). Various digital media can offer individuals and groups new vehicles for speaking out about societal issues, including matters of their identity (Beach and Smith, n.d.; Beach et al., 2017). For example, digital media may offer spaces that impose, override, colonize, standardize and restrict diverse cultural expressions and their agency. On the other hand, media platforms can also provide palates for widening the forms, as well as the reach of and possibilities for, existing or alternative engagements (e.g., Kim, 2016). Indeed, affordances can be prefabricated or customized with designs that are either barren or fertile sites for sharing and advancing ideas.

Being ethical, respectful, and responsive

Global meaning-making is not exempted from ethical considerations—especially in terms of respect for and responsibility toward others (e.g., Butler, 2011; King, 2017; Kristeva, 1991; Levinas, 1974/1981, 1993, 1995). To be contemplative, there is need to move outside of one's bubble—to engage with and consider others and the socio-political systems at play. Considerations of broader systems include examining how and what they regulate, and whose interests are served, compromised, or forfeited in the process. Also key to this contemplative process of global meaning-making and advocacy is the pursuit of actions that are respectful and supportive. In keeping with goals of examining and interrogating one's own motives and positioning, it is crucial that actions and engagements are not presumptuous or out of place with the rights and interests of others, especially in terms of self-determination and sovereignty.

To engage in global meaning-making requires occupying a moral ground that bridges across and within nations, identities, cultures, and communities (e.g., between the privileged and the marginalized; across gender and races; and between Indigenous and immigrant cultures). It encompasses a journey across complex and diverse terrain (ecologically, epistemologically, and ethically). As Kohlberg (1981) suggests, there may be a seventh level of moral reasoning, to which global reading and research should aspire—a level that looks more broadly at the ethics of decision-making, aligned with a fuller and ongoing consideration of the future of a society. As Appadurai (2005) comments, this requires more than adopting an ecumenical and generous approach; it requires suspending certainty and opening oneself up to debate, to differences, and to considering grassroots internationalism as a crucible for emergent new forms of global ethics. It is consistent with arguments made by de Sousa Santos et al. (2007)—and, more recently, those by Chinese and global scholars such as Shi Zhongying (Shi and Li, 2018; Tierney et al., 2021)—of the need to decenter western epistemologies as the metonym for knowledge (i.e., to instead position the west, as a range of constituent knowledges, among other knowledges).

To achieve these moral goals, there is a need for aspirational spaces where cross-cultural meaning-making can occur on multiple levels and proceed in a manner that is responsive, respectful, relevant, and energizing. As Maori scholars [Smith \(2000, 2015\)](#) and [Smith \(1999, 2005\)](#) have argued, cross-cultural engagements should proceed in a manner that is respectful of the histories, ways of knowing, needs, hopes, and values of all. The specific circumstances of “others” should be respected, including geographies of time and space, and the ecological systems’ local norms, self-realization, and self-determination. In these challenging times, global meaning-making is not straightforward—indeed, it contends with the kind of “tricky ground” that [Smith \(2005\)](#) described for researchers attempting to navigate within and across Indigenous spaces.

As such, global meaning-making requires deliberations relative to: (1) How authors are positioning themselves; the topics and socio-cultural features that they are exploring; and the reader; and (2) How readers might position themselves—or find themselves positioned—in terms of the ideas represented and their own responses. These deliberations extend the tenets for a meaning-maker’s assessment of their own understanding. Beyond the scope and quality of their recall, readers are instead engaged in contemplating their own responses as actors in the author-reader exchange, and with the socio-cultural frames in mind. This requires a cultural reading of the people, ideas, and events, especially in terms of their politics, biases, and assumptions; the interests that are being pursued; the historical context; and how they (i.e., people, ideas, events, information) are mixed. It entails recognition of oneself and others as both audience for and subject of comments or portrayals for different purposes.

Final reflections: key considerations for global meaning-making

Global meaning-making does not offer a scripted reading of the world to be applied in a singular or monolithic fashion. Its dynamic processes are by their very nature diversified, multilayered, and multifaceted, involving fusions and adaptations of ideas and styles. Global meaning-making involves complex negotiations that are not preset or standardized, but anchored in ethics—ethics aligned with respect for the local, the pursuit of reciprocity between local and global, and ecological eclecticism ([Tierney, 2018a,b, 2020a,b](#)). The dimensions of global meaning-making outlined here are more akin to a set of values and guidelines—like compass points for telescopes, in search not of the destination but of the path forward.

Global meaning-making is a call to override the current predilection to exist in cultural cocoons and digital bubbles. It breaks away from pretailored worlds governed by practices and policies that perpetuate insularity, and use divisive representations of others (explicitly or implicitly) in public rallies, rarified scholarly spaces, or sites for teaching and learning. Instead, it involves what [Hymes \(1990\)](#) describes as a kind of dialectic between insider-outsider perspectives. Global meaning-making is rarely solitary; instead, engagements are participatory. It involves multiple colleagues and collaborators with local knowledges, Indigenous histories, migrant pasts, and cultural moorings from a range of places—including Oceania, Asia, the Americas and Africa.

The dance of global meaning-makers

For the global meaning-maker, these meaning-making engagements involve crisscrossing global time and space. It not only involves forms of cultural studies but also participatory engagements, sometimes with the aid of cultural intermediaries. At one level, a reader’s sophistication in terms of engaging with these processes is relative. It is anchored in their pre-existing knowledge about people, places, and times; their adroitness and the tools available to support them as they move with others within and across borders of space and time; and their ability to adapt and adjust to shifting norms and expectations. At another level, global meaning-makers require knowledge of themselves as they step in, out, and to the side of worlds to observe and engage with others with respect. Global meaning-making thus requires self-interrogation of one’s own enculturation—a continual scrutinizing of one’s interests, activities, positionality, perspectives, and biases. As [Spivak \(1988\)](#) cautions, such self-examinations should be ongoing, lest they become aligned with the systems they purport to challenge.

Global meaning-makers should be especially careful not to position themselves as the saviors or champions of others. As [Abdi \(2015\)](#) warns, well-intended allies or advocates should be alert to those tendencies that merely give the appearance of eclecticism:

[There is] a European predestination to save non-cultured natives from themselves ... [and] we should not discount ... the need to see beyond the fog of the still problematically benevolent political correctness as the creators of the new scholarship are somehow oblivious in turning the gaze upon themselves and societies (p. 16).

This undoubtedly requires a study of self that seeks to challenge both self-righteous objectives to enfranchise as well as failures to self-implicate. Global meaning-makers should, as [Spivak \(1988, 1990\)](#) suggests, be contemplative as they reconcile their complicity with their own privilege, and adopt dispositions and approaches that are not presumptuous, colonizing, or recolonizing.

Global meaning-makers as critical culturalists

Indeed, global meaning-making entails reckoning with oneself and one's cultural ways of knowing as one journeys across borders with others, with and for the interests of all. It represents a mix of participatory literacy, promoting approaches that are cooperative, collaborative, and contrastive while being respectful and reciprocal. It befits a planetary view that is ecumenical and emancipatory. A key thesis undergirding the rationale for global meaning-making is the advancement of "other" alongside of "all," in concert with accommodation for (rather than assimilation of) differences; that is, the pursuit of eclecticism in support of a global complementarity or inter-operationality. It entails a turn from self-righteousness to critical reflexivity, and from imposition and imperialism to respect and restraint. As global meaning-makers develop cross-border understandings, they also challenge their insularity, ignorance, and historic depreciation of others. They interrogate their complicity with their own advancement—reckoning with their own assertions of global jurisdictional mandates, or engagement in misinterpreting, misrepresenting, or disregarding the sovereignty, languages, ways of knowing and cultures of others. Similar to what Cochran-Smith (2000) suggested in her discussion of racism, global meaning-makers need to interrogate their "own complicity in maintaining existing systems of privilege and oppression" (p. 186).

Global meaning-makers are therefore expected to read for socio-political currents and pursue critical forms of advocacies that are committed to advancing diversity. In so doing, they engage in an ethics of respect for others and support for personal sovereignties. At the same time, they are never untethered from their own histories, predispositions, and positioning (e.g., the influence of mainstream imperial forces of colonization, as seen in marketing strategies tailored to digital user profiles). To fuse self with others, global meaning-makers must engage with persona and ethos, the pragmatics of language use, and notions of identity over space and time. As they consider the diverse circumstances within and across countries and cultures, their communications may take the form of translanguaging and other means of criss-crossing meaning-making communities. As Willinsky (1998) suggested, meaning-makers should engage not as imperialists but as critical culturalists, working across borders with a view of themselves as foreigners in support of others (see also: Kristeva, 1991).

Global meaning-making is contemplative, analytic, and advocacy-oriented

As noted by postcolonialists, meaning-makers can too often find themselves confined to sites where forms of epistemological imposition and resocialization occur. These insular sites might be tailored to Eurocentric traditions that befit colonialist or assimilationist models rather than those espousing epistemological eclecticism, Indigeneity, and internationalism (Abdi, 2015; Connell, 2007; Nozaki, 2009; Takayama, 2009; Takayama et al., 2017). Unwittingly, everyday meaning-making pursuits and understandings can be permeated by media that silences concerns and reinforce complicitness with regulatory practices. By contrast, the pursuit of global meaning-making is a call for exchanges to flow across and within a futuristic, pluralistic world. Its approach to everyday literacy involves shared responsibilities as well as alternative spaces that afford expression and exert change. These ideas reflect Gutiérrez's (2008) discussions of a third space—an aspirational hybrid space wherein exchanges flow across cultural identities and positionalities, in accordance with the socio-political dynamics of students' worlds and their communities. Within this third space, improvisations within and across borders and identities serve to both empower engaged individuals and improve the group.

Global meaning-making requires support for and commitment to engaging with forms of border-crossings, as one steps across or out of line. It is more provocative than neutral, and more disruptive than disassociated. In that way, it is similar to forms of counter discourse, coupled with proactive engagements, such projects or praxis, directed toward transformative change. To these ends, global-meaning making processes of contemplation, analysis, and advocacy are crossed with the following combination of stances:

- Responsive: To be open to consider and address matters of human rights and planetary responsibilities that arise or exist locally and globally;
- Perspectival: To enlist different perspectives, especially those stemming from considerations of context and relevance, so that engagements are respectful, responsive, and proffer understandings of events that illuminate different understandings;
- Evaluative: To delve into different readings to consider the assumptions, norms, and tenets that serve as the bases for perspectives and understandings—that is, to bear responsibility for judging the ideologies represented in and by the text, including the systemic forces at play that undergird societal hierarchies and frame exchanges;
- Reflexive: To maintain responsibility for recognizing one's frames and their nature or potential for influence—especially in terms of limiting or skewing understandings; to acknowledge self-interest; and to respect the interests of others (i.e., systemic forces, Indigenous interests and ways of knowing, etc.);
- Proactive and Transformative: To promote and pursue agency, advocacy and transformative change (i.e., forms of systemic change that address the development needs of communities in ways that are respectful, organic and sustainable).

In other words, global meaning-making involves a mindfulness toward the world. It demands agency, responsibly and respectfully acting upon socio-political discernments in ways that are ethical and community-based. It entails acceptance and reconciliation that are informed by a planetary epoch outlook and embrace plurality and universal rights. And it requires reckoning with, challenging, and changing hegemonies, with a reverence for the sovereignty and various ways of doing by others. Indeed, it is the standard for transformative engagements globally—distinguished from engagements that seek merely to understand others, analyze and critique

socio-political systems, embrace multiculturalism, or promote culturally-responsive or reciprocal education or pronouncements. Whereas prior notions of meaning-making may have defined bringing life to the page as simply building on and from one's background knowledge and experiences, global meaning-making represents a shift in the intimacy of one's engagement with texts and the world of media. It suggests discernments and contemplations that move beyond the page as one considers possibilities, recognizes one's role in relation to others, and acts carefully, respectfully, responsibly. Further, as action-oriented meaning-making, this process engages readers in interrogating their own readings and the socio-political dispositions of the texts before responding—seeking to eschew actions that are well-meaning but perhaps presumptuous or may align with systems and hegemonies that undermine their intent.

Closing summary

Global meaning-making assumes all behaviors are political; that responsible and responsive meaning-making respects and serves the interests all of our worlds; and that meaning-makers' engagements seek to change, challenge, or mitigate unjust systems. This view builds upon discussions among the growing circle of literacy scholars invested in global thinking, especially those researchers who investigate translanguaging, hybridity, global mobility (e.g., Lam and Warriner, 2012; Nelson et al., 2016; Pieterse, 2005; Rizvi, 2009a; Robertson, 1985), and global citizenship (e.g., Torres, 2015; UNESCO, 2015b). It stems from the search for other spaces, as discussed by Gutiérrez (2008, 2011) and Gutiérrez et al. (1999), and the argument for a more generous countenance that is respectful of cultures (e.g., Campano et al., 2010; de Sousa Santos, 2007b, 2013; Singh et al., 2005; Stein, 2017b). It draws heavily upon issues of mobility—in terms of people, cultures, and literacies. It is consistent with the model of community-based literacy events and practices explored by Victoria Purcell-Gates (2006) and her colleagues (Purcell-Gates et al., 2011); explorations of the participatory dynamics of literacy across time and space (e.g., Dyson, 1988, 1989; Jenkins et al., 2009); and pursuits of epistemological diversity, especially Indigenous ways of knowing (e.g., Assié-Lumumba, 2017; Battiste and Henderson, 2000; Bishop, 1994; Connell, 2007; de Sousa Santos, 2007a; Nakata, 2001, 2004; Rigney and Hattam, 2018; Rigney et al., 2018). It also aligns with the transliteracy framework outlined by Stornaiuolo et al. (2017). This transliteracy approach explores dimensions such as emergence, uptake, resonance, and scale as a way of capturing “different kinds of relations among people and things—whether in horizontal, vertical, rhizomatic, or other relationships—and highlight(ing) people's literacy practices within and across systems that (re) produce, exacerbate, and/or challenge social inequities” (Stornaiuolo et al., 2017, p. 84).

Broadly speaking, global meaning-making comprises a triad of critical contemplation, analysis, and advocacy, stemming from the convergence of socio-cultural, critical, and globalist views. As noted, it builds upon socio-cultural views of reading (e.g., Garcia and Kleifgen, 2020; Lee, 2020; Purcell-Gates, 2006); discussions of globalism (Rizvi, 2009a; Robertson, 1985; Singh et al., 2005); and postcolonial epistemologies (e.g., Connell, 2007; de Sousa Santos, 2013; Said, 1979, 1993). Global meaning-makers are akin to researchers as they position themselves, grapple with their identities, and scrutinize texts amid the cauldron of global socio-political forces involved. They examine events, settings, characters, and issues from different perspectives as they observe and participate aesthetically, vicariously, efferently, and critically. Their worlds (virtual, real, read, or reported) involve complex social dynamics within and across individuals, families, communities, and cultures. Hopefully, in keeping with discussions of pluralism, they come to see how the worlds of others are also part of their own. They may contemplate and contribute to transformative engagements arising from disrupted complacencies, changed understandings, and questions regarding the systems that perpetuate perceived cultural and planetary affronts.

Global meaning-making involves cultural moves that go beyond comprehension approaches focused upon just reading for understanding. It moves beyond evaluation of texts in terms of their factual bases, or the quality of their arguments. Instead, it entails examining texts, positions, and cultures—as well as the people within them. It asks meaning makers to unmask, reflect, and act upon socio-political analyses. It is at the cusp of enacting change that embraces pluralism and does not slight diversity. It aligns with challenges to our critical illiteracies and calls for reading our worlds.

Introduction

In recent years, scholars have theorized the “global” in literacy research by turning toward critical perspectives, especially those that deliberately decenter the west. Some examples include a global literacies manifesto challenging “assimilative tendencies, a politic of Western exclusiveness, and racism” (Tierney et al., 2021, pp. 294–295) and a transnational consortium of authors collaborating on an international handbook to reframe “critical literacy work in diverse sociocultural contexts to counter the often-Eurocentric foundations of its academic lineage” (Pandya et al., 2022, p. 4). Such work builds on foundational scholarship theorizing the ideologically, culturally situated, and mobile nature of global literacy practices (Brandt and Clinton, 2002; Street, 1984, 2003) but also foregrounds issues of power and globalization in relation to colonial histories (e.g., Lammers and Astuti, 2021; Mora and Cañas, 2020; Sánchez and Ensor, 2021; Yoon et al., 2018). We are interested in exploring how this critical turn to studying the global in literacy research articulates with global frameworks like cosmopolitanism, a theory often traced across western thinkers from Diogenes to Kant (Kleingeld and Brown, 2019) that focuses on how people negotiate conflicting identities and loyalties as they make meaning across cultural, linguistic, and ideological differences (Appiah, 2006; Hansen, 2011).

In literacy research, cosmopolitanism has been a fruitful direction for literacy scholars interested in global issues. In scholarship about cosmopolitan literacies, for example, researchers have explored how cosmopolitanism’s central tenets—the recognition of people’s shared humanity and commitment to learning from and with one another through cross-cultural dialogue—are both rooted in local practices and intimately tied to people’s multimodal literacies on the move (e.g., Bean and Dunkerly-Bean, 2020; Campano and Ghiso, 2011; Choo, 2018; Hull et al., 2010; Hull and Stornaiuolo, 2014; Juzwik and McKenzie, 2015; Smith and Hull, 2012; Spires et al., 2019; Sánchez and Ensor, 2020; Vasudevan, 2014). In recent years, literacy scholars have critiqued more liberal approaches to cosmopolitanism rooted in western, Enlightenment-centered visions of global togetherness for forwarding neutral, essentializing, and universalizing conceptions of multicultural belonging that can obscure, elide, or reproduce differences as much as celebrate them. Scholars have drawn on critical cosmopolitan perspectives (e.g., Canagarajah, 2012; Delanty, 2006; Mignolo, 2011; Robbins and Horta, 2017) to theorize how these differences have emerged, tracing how power asymmetries rooted in histories of racism, colonialism, and oppression have shaped the current global landscape and people’s literacy practices across national, linguistic, and cultural contexts (e.g., Campano and Ghiso, 2011; Canagarajah and de Costa, 2016; Sanchez and Ensor, 2021; Stornaiuolo, 2016; Stornaiuolo and Nichols, 2019; Yoon et al., 2018; Zaidi and Choo, 2021).

Leaning into this critical direction, we consider whether cosmopolitanism remains a useful lens for theorizing the global in people’s meaning making practices. Specifically, we explore what a decolonial approach to cosmopolitanism might offer the field of literacy research. At the center of this exploration is our concern about the nature—and limits—of understanding: How can people understand one another when they are positioned within colonial systems that “reproduce the blind epistemic ethnocentrism” that centers normative (white, western) ways of knowing as the default (Mignolo, 2002, p. 66)? We begin by delving into this question of what it means to know across asymmetrical systems of power—and whose epistemological ways of being in the world are recognized, centered, and foreclosed as a result.

Cosmopolitan literacies and asymmetric ignorance: the limits of understanding

In a digitally connected but increasingly polarized world, one of the most pressing questions facing educators and researchers revolves around how people come to understand one another. Scholars proposing cosmopolitanism as an ethical framework for addressing this challenge suggest that dialog represents a key strategy for developing mutual understanding of our shared humanity even while “rooted” in specific local histories (e.g., Appiah, 2006; Hansen, 2010). Dialog has been an important cornerstone for literacy researchers interested in tracing people’s cross-cultural meaning making practices, which Hull and Stornaiuolo (2014) discuss through the lens of cosmopolitan literacies, defined as “the cognitive, emotional, ethical, and esthetic meaning-making

capacities and practices of authors and audiences as they take differently situated others into account" (p. 17). "Cosmopolitan literacies" has been a generative frame for understanding the ethical dimensions of how people make meaning with and for others across cultural, linguistic, geographic, and ideological differences in a digital era, as people draw on circulating texts, stories, media, and their epistemic experiences as resources for self-imagining in relation to others in the world (cf. [Campano and Ghiso, 2011](#); [Stornaiuolo, 2015](#); [Vasudevan, 2014](#)). In other words, theories of cosmopolitan literacies highlight the question of how people *come to understand* locally and globally through multimodal meaning making practices.

In an effort to address critiques of cosmopolitanism, particularly around its Eurocentric roots and tendency toward color-blind universalism, literacy scholars have turned to critical approaches that center issues of power and privilege and offer possibilities for transforming our world(s) through collective action. [Stornaiuolo and Nichols \(2019\)](#), for example, draw on cosmopolitical thought (e.g., [Stengers, 2010](#); [Watson, 2014](#)) to foreground the historical, sociomaterial conditions that reproduce inequities and the "active political labor required to construct common worlds across difference" in light of these conditions (p. 2). [Zaidi and Choo \(2021\)](#) propose cosmopolitan critical literacy as "a more progressive and proactive way of empowering students to engage with the multiplicity of cultures and cultural differences in our global age" in culturally and linguistically diverse classrooms (p. 453). [Kerkoff \(2022\)](#) suggests that a critical cosmopolitan lens involves using literacy practices to dismantle hierarchies and take justice-oriented action from a global perspective. And [Yoon et al. \(2018\)](#), guided by [Freire's \(1970\)](#) critical pedagogy and scholarship on global and multicultural education, suggest that the transformation of the world requires understanding our interconnectedness in relation to others. While these and the many other critical approaches to global and cosmopolitan literacy practices do attempt to take account of histories and systems of power, we suggest that they do not—and perhaps cannot—unsettle one of the fundamental tensions of cosmopolitanism: its role as a colonizing project for imagining the "other" that continues to center white, western ways of knowing.

Framed as a means for the west to conceive of the "other," cosmopolitanism is deeply intertwined with histories of colonialism, with individual notions of personal rights that are "rooted in maintaining otherness. The fact that one needs rights continually extended works to inscribe one as perpetually foreign" ([Barton and Tan, 2020](#), p. 435). These beliefs about individual rights intertwine with visions of shared humanity to cast individuals from the English-speaking "West" in central positions (e.g., as hosts, inviting "global others") and position others in the margins (e.g., those who are invited, imagined in the hosts' own image, perceived as not fully human). Discourses of hospitality (guest and host) and inclusion (inviting people into existing spaces) that perpetuate this "othering" continue to permeate cosmopolitan thinking—scholars consider how to create cosmopolitan dispositions, expand access to resources, and give voice to others, all the while projecting their imaginaries on people from their own vantage points. [Cusicanqui \(2012\)](#) describes this projection as continuing to center white, western, normative perspectives, arguing that inclusion, while seemingly benign, represents "a mitigated and second-class citizenship that molds subaltern imaginaries and identities into the role of ornaments through which the anonymous masses play out the theatricality of their own identity" (p. 100). Discourses of individual rights, hospitality, and inclusion make it *seem* like we are working toward a more just, shared world but continue to center colonial systems that reproduce normative perspectives, without making any conceptual or structural shifts needed to dismantle power asymmetries or understand people on their own terms ([Chakrabarty, 2000](#); [Cusicanqui, 2012](#); [de la Cadena, 2015](#)).

One of the ways this fundamental tension plays out in global literacy scholarship is that scholars who draw on critical cosmopolitan frameworks can continue to reproduce colonizing structures *without even recognizing that they are doing so*. [Chakrabarty \(2000\)](#) calls this "asymmetric ignorance," as scholars from subaltern positions must recognize and take into account western ontologies, but those from majoritarian positions do not need to understand or even acknowledge other ways of knowing, being, or theorizing (and often lump together "non-western" histories as beneath notice). This "inequality of ignorance" ([Chakrabarty, 2000](#), p. 28) means that scholars embedded in colonial discourses and systems do not even know that they do not know or recognize the labor of the subaltern, instead assuming that their ways of knowing are the default—something [Mignolo \(2002\)](#) calls "blind epistemic ethnocentrism" (p. 66). Literacy researcher [Thomas \(2019\)](#) describes this phenomenon in terms of the "imagination gap"—the impossibility of imagining worlds different from the ones we inhabit—as it pervades people's meaning making practices, locating such a gap in racial metanarratives that cast white characters as protagonists whose perspectives are centered and either omit characters of color entirely or relegate them to stereotypes or caricatures that revolve around the white protagonist. In light of this asymmetric ignorance that limits people's capacity not only to imagine another's perspective but to realize that they are in fact inhabiting different worlds, we wonder: just as "inclusion" has limits ([Barton and Tan, 2020](#)), what might be the limits of understanding?

To unpack this question, we turned to decolonial theories of cosmopolitan worldmaking ([Carrington, 2015](#)) and indigenous theorizing of the onto-epistemological nature of understanding ([de la Cadena, 2015](#); [Todd, 2016](#)). These theories highlight that to make space for diverse others, to understand them, and to highlight their "epistemic privilege" ([Campano, 2007](#); [Campano and Ghiso, 2011](#); [Mohanty, 2000](#); [Moya, 2000](#)) requires recognition of the "(Western/colonized) epistemic tools and ontology [that] allow us to see things a certain way, and in ways that close certain ontology and epistemologies to us" ([de la Cadena, 2015](#), p. xxv). While the logic of coloniality ([Quijano, 2000](#)) has meant that western subjectivity is not only more legible but also deeply embedded in our texts, visual media, and ways of reading the world to both those who are from the west and those who are not ([Chouliaraki, 2016](#); [Ghiso and Campano, 2013](#); [Leonardo, 2018](#); [Mignolo, 2001](#); [Mignolo and Ennis, 2001](#)), the reverse may not be true. Non-western epistemes and ontologies are not always recognized or engaged with by those who are situated in hegemonic western spaces ([Todd, 2016](#)). Critical frameworks like cosmopolitanism can still end up offering a "conditional inclusion" to the other based on what is legible to those who are rooted in the western epistemes ([Cusicanqui, 2012](#), p. 100). While those from other epistemes are able to (or have had to) read the western world, those working with hegemonic western epistemes are often unable to do so, creating asymmetric ignorance ([Chakrabarty, 2000](#))—the recognition of which serves as a productive starting place for the reimagining of cosmopolitan literacies.

Cosmopolitan literacies as ways of worldmaking: navigating incommensurability

Given that people's ways of understanding and making meaning in the world are bound up with the epistemic tools and ontologies available to them, an important place to begin any reimagining of cosmopolitan literacies centers on the practice of worldmaking. Worldmaking recognizes that there are many different world versions and visions with each of these of interest and importance to those who are involved in its making (Goodman, 1978), allowing for a radical pluralism that does not distill differences (Ricoeur, 1982). Expanding on Goodman's (1978) definition of worldmaking, Ricoeur (1982) points out that "no version (of the world) is the basic one and the other derivative," asking us to discard the idea that our worlds are versions of one and the same "neutral and underlying world" (p. 108). We use these explications offered by Goodman (1978) to emphasize the need to *recognize* that we (all) occupy fundamentally different worlds. This *recognition* does not attempt to understand differences, but rather accepts that we may never fully know each other. Our understandings of our worlds are shaped by our onto-epistemologies (Barad, 2003, 2007; Canagarajah, 2019; Watts, 2013) that are not just different but that these differences exist along with similarities: making meaning together does not depend on sharing overlapping notions. As anthropologist de la Cadena (2015), who engaged in a 10-year ethnographic study with the Quechua people, shares—creating equivalences erases differences that are just too palpable (p. 3). de la Cadena (2015), like Glissant (1997), asks us to sit in comfort with this understanding that we may know each other only with intermittencies and that we are limited in how much we can really get to know another (p. 3). Working from the premise that we can never fully understand another also opens the possibilities of (or recognition of) other ways of knowing and being in the world. Worldmaking involves a re/making of worlds from the worlds already on hand (Goodman, 1978). This remaking by people invites us to think, to feel and move in the (their) world as a way to build connections between worlds—to imagine otherwise (Storinau, 2015). Being attentive to worldmaking practices of others offers the possibility of knowing each other and the world more (not better) and rethinking the tools that we use to know the world.

While people's worldmaking practices offer the possibility of extending our knowledge about others (and the world), we recognize that our reading/understanding of their world is always going to be incomplete. There is much to learn from our differences (Appiah, 2006), yet much will escape a mutual understanding. Cosmopolitan frameworks call attention to the importance of creating a sense of a shared world so that we continue to learn from one another (e.g., Appiah, 2006; Hansen, 2010). However, even with shared spaces and practices one may never fully understand another. Our communication with each other does not depend on us having shared understandings, or making our "different notions equivalent" but knowing that we can never fully comprehend the other (de la Cadena, 2015, p. 3); in other words, our worlds may be incommensurate. de la Cadena's (2015) emphasis on knowing more about each other versus knowing better offers a way to navigate differences. It highlights for us that while *we can't make claims to understanding another, we can recognize that there are other ways of moving, being, and knowing in the world*. This recognition does not foreground one knowledge over another; instead, it allows us to "rethink differences in ontological terms" (Foster and Reichman, 2015). "Making space" for (each) other necessitates being in comfort with differences and not working toward creating equivalences or building common grounds. Practices that ask of us to work toward mutual or shared understandings may inadvertently work toward erasing differences and foreclosing certain knowledges, inevitably making some knowledges less.

To address these incommensurabilities—and recognize and navigate the asymmetric ignorance that is involved in worldmaking—requires an explicitly decolonial approach. Mignolo (2018) points out that colonial differences are masked by language and signs, so the work of decoloniality is to understand what is hidden in such denotations (p. 186). Decolonial options involve "unveiling the logic of coloniality and the prospective task of contributing to build a world in which many worlds will coexist" (Mignolo, 2011, p. 54). For Carrington (2015), the innovative worldmaking practices and strategies that black diaspora communities have adopted to navigate spaces for and by white supremacy represents cosmopolitan worldmaking. He defines it as the "conscientious orientation toward the necessity of acquiring and deploying knowledge that will enable one to negotiate multiple fields of possibility" (p. 254). Through these worldmaking practices people fashion themselves and the worlds they inhabit (Dattatreya, 2020) as the center of their world—the "negotiating of visibility on one's own terms" (Carrington, 2015, p. 250). Carrington invites us to recognize these cosmopolitan practices as a "concentrated effort to intervene critically in the conditions of cultural production" (p. 246). Artist Kehinde Wiley's work that Carrington studies counters the racially coded and fetishistic images of white artists that presents "blackness as the other" (p. 250) by redefining how black bodies are represented in his art. This is a powerful subversion of the normative visual culture around black bodies.

These practices that allow people to tell a story (or restore a mainstream narrative; Thomas, 2019) offer a "horizon imbued with potentiality" (Munoz, 2009, in Govindarajan, 2018), yet it would be remiss not to acknowledge that through this worldmaking, others are not necessarily inviting everyone to make sense of or engage with it. We think here of Toni Morrison's mission to write for and to black audiences apart from the white gaze and outside of the white imaginary. To this we add that the non-western other occupies space through their cosmopolitan worldmaking practices and also offers the possibility of transformation in societies by opening up space to imagine and engage with other worlds on their terms. Though these might be seen as radically subversive acts, subversion might not always have been the intent (Govindarajan, 2018): not everything is oriented or responsive to white, western imaginaries. We present a case study of worldmaking to illustrate how worldmaking practices that challenge any molding of the imaginaries about the subaltern.

Worldmaking as practice: a palimpsest (case study)

We turn now to a case study illustrating this vision of worldmaking, focusing on an artist, “@vvrzone,” who juxtaposes anime characters with images from Kashmir on Instagram. The images they use are a part of the popular imagination of Kashmir, ones that invoke its beauty—the post card images speak to the metaphors often used for Kashmir, such as “Paradise on Earth,” “Jewel in India’s crown,” and so on—images that place Kashmir in a beautiful pristine past. There are also images of more modern elements of Kashmir life, from downtown streets to cafes and bedrooms. It is on these very images that the artist layers anime characters and other anime elements (their profile describes it as *Kashmir x Anime*). In the images we share here (and for which we have received permission from the artist), we see the juxtaposed scenes from a bucolic or modern vision of Kashmir remixed with anime characters (Figs. 1 and 2).

The remix is at once beautiful and modern, with anime bringing in a stateless quality (Naylor and Helford, 2014) to offer the viewer a place from which to view a Kashmir that is not a contested land. Though we are not delving into the nuances of the various anime characters that the artist layers onto each image (each anime character has their own world, politics, and possible imaginings), broadly, the stylized characters and the speculative nature of anime provides for an imaginative liberation that visually disconnects (Posadas, 2014) or loosens Kashmir from its history of oppression and the current militarized state. Cities and bodies mutually define each other. By juxtaposing anime pictures on images of a place that faces a turbulent past, present, and future, the city and the (anime) body produce, transform, and define each other (Thompson, 2007). In this speculative reimagination, the artist and their land move to a transnational identity, in conversation with and connected to other modern states and subjects (Suan, 2018). The artist themselves become a modern subject. A basic google search for Kashmiri art reveals pages of traditional

Fig. 1 Nature image from @vvrzone's *Kashmir x Anime* series.

Fig. 2 City image from @vvrzone's *Kashmir x Anime* series.

folk art—far from the artist’s imaginings of *Kashmir x Anime*. Their worldmaking practices offer, to us as readers, a powerful response to the colonial representations imposed on Kashmir and the Kashmiri subject by Neocolonial India (Carrington, 2015) and to those who are a part of this networked space of artists on Instagram. In the images created by @vvrzone, everydayness is disidentified with the prevailing concepts about Kashmir.

For Goodman (1978), worldmaking “always starts from worlds already on hand; the making is a remaking” (cited in Nünning and Nünning, 2010, p. 2). @vvrzone’s stylistic explorations of the writing, the remixing and juxtaposing of anime characters on the postcard-like-pictures, is a remaking of time and space from their location as a Kashmiri. The new image is, however, not built as “a tabula rasa but a palimpsest” (Carrington, 2015, p. 252), where the original image has been effaced to make place for new, but the traces of the older image remain (worlds are always made from other worlds) and informs the viewer of the historical context and setting in which the art is produced. Art’s style is shaped by historical facts, offers insights into a particular way of seeing the world and to the artist’s worldmaking practices (Carrington, 2015). The artist’s worldmaking practices in this case reconceptualized Kashmir for insiders and outsiders, but that reconceptualization is also dependent on where one is located in relation to those histories. For example, how Rabani made sense of these histories of Kashmir intersected with her own experiences of having lived there as a child in the early 80s in a military camp, her understandings about the complicated history of the military presence in the region, and her broader sense of the place formed through friends, colleagues, and activists from Kashmir and the media. For Amy, none of these histories surfaced in the palimpsest, with her white, western, US-centric lens investing these bucolic scenes with esthetic appreciation for a beautiful place and for the inventiveness of layering in anime characters but without any historical sense of either—a place of asymmetric ignorance that made any deeper interpretation challenging (she was not even aware of these histories until Rabani made her aware and even then could not imagine the historical, political, social, and cultural resonances and implications).

This incommensurability of “understanding” across different interpretations provides a compelling argument for what a decolonial approach to worldmaking offers researchers interested in cosmopolitan literacies. Our interpretations of @vvrzone’s art are our own representations, superimposing our worldviews over theirs. Yet the important point here is that @vvrzone, as an artist, is asserting their worldview, offering their interpretive lens to others as resources for meaning making. What we as viewers do with those representations certainly matters—as history points out, efforts to silence, distort, and appropriate people’s art and texts is rampant, particularly for individuals from historically oppressed groups. Yet, our interpretations also *do not* matter in another sense—@vvrzone’s perspectives exist separate from our responses to their work, whole on their own without our validation or interpretation of them. Part of what makes this turn to worldmaking so important is that we must learn to be comfortable with incommensurability, to what we don’t and maybe cannot ever know. This does not mean we cannot work toward mutual understanding, but even when that understanding does not emerge, we can work toward mutual recognition—recognition of others’ representations of their own worlds, on their own terms and for their own purposes; and recognition of our own ignorance of others’ worlds, and the asymmetrical contours of that ignorance, as shaped by histories of empire, colonization, racialization, and patriarchy.

Conclusions: cosmopolitan literacies, ethical relationality, and the practice of mutual recognition

We turn now to consider what this decolonial, ontological turn in cosmopolitanism might mean for scholars interested in cosmopolitan literacies. We have argued that the practice of mutual recognition is undergirded by a decolonial cosmopolitanism that Mignolo identifies as “a radical shift in the geopolitics of knowing and being” (p. 37), one that “dwells in the borders, in exteriority, in colonial difference” (p. 39) and emerges not from the center but from the margins: from artists like @vvrzone and Kehinde Wiley who are using the multimodal semiotic tools at their disposal to engage in a “concentrated effort to intervene critically in the conditions of cultural production” (Carrington, 2015, p. 246). As Carrington (2015) suggests, cosmopolitan worldmaking from the borders involves purposeful and thoughtful efforts not just to understand but to *know more*—which allows people to “negotiate multiple fields of possibility” from new positions (p. 254). Such a profound onto-epistemological shift to theorizing literacy practices from the borders—a move that involves shifting from seeking mutual understanding to attempting to know more—can reposition the global in more ethical relations in literacy research, we suggest.

Such a shift draws on the recognition that our scholarship is intimately tied up with who we are and how we know, and that these ways of being/knowing are shaped by colonial histories that contribute to asymmetric ignorance (Chakrabarty, 2000). This intertwining of knowing and being was illustrated powerfully in our case study of worldmaking and is described in the work of Barad (2007): “Practices of knowing and being are not isolable; they are mutually implicated. We don’t obtain knowledge by standing outside the world; we know because we are of the world. We are part of the world in its differential becoming” (p. 185). Difference represents the central organizing principle in how we come to mean together in the world—what Indigenous scholar and activist Donald (2009; cited in Todd, 2016) calls ethical relationality:

Ethical relationality is an ecological understanding of human relationality that does not deny difference, but rather seeks to more deeply understand how our different histories and experiences position us in relation to each other. This form of relationality is ethical because it does not overlook or invisibilize the particular historical, cultural, and social contexts from which a particular person understands and experiences living in the world (p. 18).

Ethical relationality, in Donald (2009) and Todd's (2016) scholarship, suggests a powerful way we might come to know more, by recognizing the differences in our worlds, tracing the contours of those differences, and seeking to know more through our differences.

One important insight for literacy educators and scholars interested in what ethical relationality means for scholarly practice involves recognizing the limits of understanding, what de la Cardena (2015) describes as the inevitable incommensurability of different worlds. The way we live with and move between different worlds as part of our everyday activity—what she calls “cosmo-life”—involves accepting translation between worlds as always incomplete: coming to terms with the fact that not everything can be translated or understood, and we do not need to seek univocal meaning or smooth out differences (p. 286). For literacy educators and researchers, this means accepting that people will create representations and manage visibility on their own terms. If representation always involves being entangled with other people's meaning making, our task as scholars is to take account of our positionality, recognizing that asymmetric ignorance (Chakrabarty, 2000) forecloses and fails to recognize certain ways of knowing/being. The only way to dismantle the ongoing colonial legacies that continue to enmesh us, anthropologist Todd (2016) argues, is to “face our complicity head on” (p. 15).

One way we might face our complicity with colonial epistemologies, Todd (2016) suggests, is to pay attention to our positions relative to others with whom we are in dialog—and to seek out whose voices may be missing from the conversation. For those drawing on indigenous scholarship, for example, she cautions scholars rooted in colonial, western epistemes to take care in how they build on and represent ideas, being careful not to ignore, romanticize, or appropriate indigenous thought but to trace histories of thought with respect for the communities and individuals involved: “Indigenous thinking must be seen as not just a well of ideas to draw from but a body of thinking that is *living and practiced by peoples with whom we all share reciprocal duties as citizens of shared territories (be they physical or the ephemeral)*” (p. 17, emphasis original). For scholars and educators interested in global and cosmopolitan literacies, practicing mutual relationality involves paying specific attention to the ways in which they are complicit in invoking global frameworks that may carry asymmetrical framings that perpetuate in a less visible way savior logics that continue to position the West (and English) as the dominant paradigm from which all “others” are imagined and understood. Critical self-reflexivity might entail asking how the metaphors, descriptions, and representations they choose can reproduce the white, colonial gaze; or who is doing the labor of translating across intermittencies; or how to engage with people's ideas and representations on their own terms. These fundamentally ethical efforts to engage in mutual recognition of people's literacy practices across different worlds—in an effort to understand or know more, and not necessarily better—represent a potential path for global literacy research.

History and definitions of literacy

Literacy is a complex and dynamic phenomenon that varies across history, language, and geography. There are competing views about the origins of literacy, which can be traced back thousands of years. For centuries, the formalization and educational roles of literacy as a tool for communication were dominated by a small portion of “educated” human society. However, over the years, many societies have experienced transitions from mostly illiterate to predominantly literate populations through various means involving both formal schooling and informal learning (in everyday practice). The present review considers literacy especially from an international development perspective.

UNESCO (2021)¹ estimates that about 86% of adults worldwide can read or write to some extent today. Nonetheless, the transition to widespread literacy has not been uniform across societies. Contexts vary greatly across the globe, and these have played a significant role in the motivation and support for acquiring literacy. For example, in Sweden, reading ability reportedly rose to above 90% by the mid-18th century as a result of the push from church and state on families to teach Bible reading at home. Among the Vai people of West Africa, literacy in the form of an indigenous script was developed and used for economic and personal written communication since the nineteenth century, a tradition that was transferred from one generation to another outside the structure of formal schooling (Scribner and Cole, 2013). This was also the case for many emerging nations, like Brazil, Tunisia and Turkey, that have moved to industrialize and enter the global market. In most of these contexts “being literate” entailed the ability to read and write in the country’s national (and post-colonial) language.

From these and other examples, it is clear that an understanding of social context is essential for understanding how literacy functions as a cultural phenomenon across the world. For decades, the framing of literacy in developing countries was strongly influenced by colonial epistemologies and the logic of the *mission civilisatrice* (Venezky et al., 1990). Within this perspective, literacy was defined principally in terms of the traits of the colonizers and elites, while the term “illiteracy” often characterized those who were poor and inferior. This is one reason why reading and writing in Western languages still constitutes the core of the global literacy agenda in which non-standard, non-European languages are mainly devalued (Wu et al., 2021). Only in recent decades has the field of literacy moved away from this restricted conceptualization.

The advent of modern public education, the increasing use of technology, and economic globalization are among the many factors that have contributed to changes in how literacy has been used over recent years. At a macro-level, the expansion of literacy work reflects the increased social complexities of our rapidly changing societies in the 21st century. At a micro-level, changes take place at different stages of an individual’s life through the learning of cognitive skills in and out of school, as well as through the diverse needs of everyday life.

Thus, formal definitions of literacy have varied over the years. A half-century ago, the United Nations thought of literacy as a dichotomous concept—you are either “literate” or “illiterate,” and that is how international statistics represented literacy in most countries (Collins, 1995; Wagner, 2011). Today, most specialists and governments think of literacy as a continuum of reading, writing, and numeracy skills that can be acquired in and outside of schools through training and practice. While some specialists today view literacy as how schools teach children how to read and write, others explain the degree of literacy acquisition as a consequence of (and contributor to) power, hierarchy, poverty and culture.

Life-span perspectives

Another way to think about literacy acquisition is to consider skills across the life-span. In the first few years of life, early language and literacy development has an impact on a child’s potential for future success. Studies have shown that skills developed during

¹The United Nations Educational, Scientific and Cultural Organization.

these years can affect future acquisition of other competences. As a result, there is a major movement toward support of early childhood development programs to provide children with basic cognitive, social, and emotional skills that set the foundation for learning literacy, numeracy and more advanced skills at later ages (UNICEF, 2019). Conversely, a lack of learning opportunities during the early years can increasingly hinder progress in the acquisition of higher order skills and future educational outcomes.

With the global growth of mass public education, primary schooling is the most common starting place for formal literacy learning, typically beginning with children between the ages of 5 and 7 years. Despite widely varying differences in primary schools across the world, the importance of literacy remains central to the curriculum across the globe (Wagner, 2018a,b). Increasing efforts are being made to assess literacy levels among primary and secondary school students internationally (Beeharry, 2021). Overall, the rapid expansion of access to primary schooling over the past few decades has resulted in a steady increase in literacy rates across the globe. Even so, increasing school access has not been able to address serious problems of low literacy in low-income countries, or among many poor children in middle- and high-income countries (Gove and Cvelich, 2011). In many low-income countries (e.g., Senegal, Bangladesh, South Africa and others), a large percentage of children are still unable to read with comprehension at the end of the fifth grade. This not only poses a serious challenge to children's future education, but will also have an impact on their potential contribution to economic growth.

Among youth (aged 15–24 years), literacy rates have been slowly improving over the past two decades due to an increased level of investment at the primary school level, notably from 83% in 1990 to 92% in 2021, according to UN statistics (UNESCO, 2021).² These literacy trends reflect increased access to primary and secondary education for younger generations and suggest that adult literacy rates will climb as youth replace older cohorts in the future. However, even now, more than 100 million youths lack basic literacy skills, mainly in two regions: South and West Asia and sub-Saharan Africa. These literacy rates are considerably lower among rural youth and girls in low-income countries. A major part of this problem results from young people who have never attended school or left school before acquiring strong literacy skills.

Adult literacy has improved somewhat for a majority of countries in the world over the past two decades. This is in part due to the ratification of the 2030 United Nations Sustainable Development Goals (SDGs), comprised of 17 goals adopted by its member states in 2015. SDG 4 is dedicated to education broadly, while its sub-goal SDG 4.6 aims to “ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy and numeracy.” Even so, many countries failed to make significant progress over this same time period, a reflection of the limited national and international investments made, and also of the complexity of motivating adults to take part in such largely voluntary programs. Demographic changes, including the increase in access to primary and secondary schooling, will no doubt continue to improve adult literacy rates, but substantial low-literacy and illiteracy will likely persist well into the future.

Thus, in spite of the considerable efforts of governments, school systems and other agencies over many decades, achieving the improvement of, and equity in, literacy development has faced considerable challenges. Both *access* (such as student enrollment and retention) and *quality* (of instruction and student learning) are critical. Barriers to student enrollment and quality education exist, particularly for children growing up in poor contexts and in developing countries. These often include structural limitations, such as lack of school infrastructure, underpaid or inadequately trained teachers, and lack of appropriate textbooks. In youth and adult literacy programs, a major challenge is to meet the diverse needs of learners who are no longer in formal school programs.

Contemporary issues in literacy

Languages and literacies in contact

One of the key policy issues in global education is the language of instruction (LOI). In low-income countries, large numbers of children (sometimes the majority) come to school not knowing the LOI in the classroom (e.g., Hornberger, 2003). Educators and policymakers have long debated the role of LOI relative to local and indigenous languages, and more recently how literacies (and orthographies) come into contact in classrooms and beyond (Wu et al., 2021). On the one hand, these complex learning contexts require practical solutions that confront political realities—such as the need for proficiency in national and official languages—and an education system's ability to adapt to different languages and literacies along with effective ways of teaching. On the other hand, the cognitive and educational realities of how children learn to read must be acknowledged. Evidence suggests that children from minority language groups do the least well in school, irrespective of which languages are already spoken and which must be learned (Wagner, 2017).

Is there a best way to implement a LOI policy? There are no easy answers to this question, due to variations in national histories and traditions as well as uncertainties about the nature of globalization, language change, and language preferences (Valdiviezo, 2013). But there is mounting evidence that teaching students to read in their mother tongue is a crucial building block for effective learning (Hélot and Ó Laoire, 2011).

Education practitioners have attempted to take a more inclusive approach to students' mother tongues and cultures through policies of multilingual education (Trudell, 2016). In recent years, there has been a strong movement toward the use for early

²Official UN literacy rates are rarely based on direct measurements, but are rather estimates linked to schooling rates (Wagner, 2011).

reading (as early as the pre-primary years) of the child's first language (L1), as contrasted with a second language (L2), especially when considering students in disadvantaged communities who are from language minority groups. In a recent review, the [World Bank \(2021\)](#) found that 37% of children in developing countries are not being taught in L1, or about 250 million students worldwide. The same study supports the view that learning in L1 would allow children to have more time to gain initial proficiency in reading before moving on to L2, so that they could stay in school longer.

Even so, L1 does not always correspond to the mother tongue(s) spoken by the community at large. This is especially common with diglossia: a situation in which two or more dialects of the same language are used by some speakers in different contexts ([Ferguson, 1959](#)). Diglossia involves the use of two language varieties: one often designated as "High" and used for formal, written interactions; the other is the native variety designated as "Low" and used for informal, everyday interactions. In North African countries, for example, schooling in L1 is done in the "High" variety of Arabic (*Fusha*), as opposed to the local Arabic dialects (*Darija*). Teaching schoolchildren to read in a non-native variety of their language raises a set of unique challenges to learning and literacy in the early years. Within similar linguistic contexts, children are also often faced with an additional challenge of navigating multiple literacies at the same time. In Tunisia, for instance, children have to juggle not just the speech varieties between *Darija* and *Fusha*, but also the differing orthographies of the official L1 (Arabic) and L2 (French).

As noted above, the L2 used in schools typically corresponds to the language of the former colonizing country. This is the case for many former French colonies in Africa who have adopted French as their L2. Today, national education policies often require children to learn in languages that they and their teachers do not know well, an issue that contributes to low levels of reading achievement. Resistance to mother-tongue instruction by parents is also a recurring issue across contexts, and is often due to the parental views concerning national identity and socio-economic mobility. Still, language contexts are often highly dependent on local cultural variables so that, in some contexts, learning in a second language first does not always produce inferior results ([Wagner et al., 1989](#)).

Teachers play a major role in any language-sensitive education program. Often, teachers are not sufficiently trained to actually implement L1 reading policies because they were trained in government-run institutions in an official L2 language ([Piper and Miksic, 2011](#)). And, they may also lack the quality teaching and learning materials needed for teaching in L1. In other words, the ability of schools and teachers to implement a bilingual policy is necessarily limited by teachers' language competencies. Further, teachers' actual use of the school-mandated language of instruction may vary widely in practice, resulting in significant differences in students' language mastery by region and by instructor ([Ball et al., 2014](#); [Commeyras and Inyega, 2007](#)). In numerous countries, teacher deployment policies (i.e., putting teachers with particular language skills where they are most needed) often do not match the national language of instruction policy. For education systems with strongly centralized teacher recruitment and allocation processes, a structural shift in these processes is needed in order to ensure an adequate match between teacher's oral and written language skills and the levels and needs of the students ([World Bank, 2021](#)).

Overall, key questions around L1 and L2 languages and literacies remain unresolved: When should teaching of L2 reading begin if it is a nationally required language? Should L2 reading instruction co-occur with curricular content in L2? What are the best ways to support the transfer of reading skills from one language to another, and when should the transition from L1 to L2 occur ([Benson and Wong, 2015](#))? In contexts of conflict, fragility, or migration, how should language policies be shaped to accommodate students' learning? How can language of instruction policies be inclusive and responsive to the needs of students with special learning needs? The complexities of language of instruction continue to be a major challenge to reading development worldwide.

Technology and literacy

Technology has become indispensable for the ways in which we organize our lives. The [International Telecommunications Union \(2019\)](#) reports that 53.6% of the world's population has access to the Internet with a continuing upward trend in information and communications technologies (ICT) use and access. Additionally, almost all of the world's population lives within range of a mobile-cellular network. However, the lack of skills required for ICT use by students and learners of any age remains an obstacle to Internet access.

ICTs (including the Internet and mobile phones) are having a major impact on our thinking about literacy as well. Observational surveys ([OECD, 2019](#)) indicate that young learners in wealthier communities actively use websites, message boards, social media, and so on. If given a choice, they often prefer social interaction on the Internet or mobile devices instead of listening passively to an instructor or reading a textbook. Others have found that reading skills are significantly impacted by continuous interaction with web-based reading. It is also clear that young children with access to mobile devices have many new opportunities and ways to learn to be literate ([UNESCO, 2014](#)). In addition, ICTs provide a "lower barrier for entry" for learners to create texts themselves, rather than to simply consume written material.

If designed appropriately, ICTs can help to make the development of teaching and learning materials for language and literacy learning easier, cheaper, and faster. There are several existing tools that serve to create and adapt reading books for practice, textbooks, and teachers' guides. ICT-based reading programs have the capacity to determine appropriate linguistic scopes and sequences. They can also produce decodable text materials that children can use to supplement their learning. For example, ICT tools can follow student's learning sequentially, starting out with common and easier sounds and letters or symbols and moving up to less common and complex ones ([Castillo and Wagner, 2019](#)).

With recent developments in artificial intelligence, technology is gaining the ability to analyze spoken language and even correct pronunciations. Students can use such technologies to check their own performance and learn about the meaning of words, phrases and spoken or written discourses, and receive tailored and personalized tasks to their performance levels, of particular use in multi-level classrooms (Castillo et al., 2022). Additionally, in contexts where little is known about the languages spoken, technologies like data mining from cell phones or social media can help policy makers in mapping and tracing languages in particular communities or settings in a quick and cost-effective manner.

Despite these promising benefits, access to learning technologies remains limited in many communities in low-and-middle-income countries. Barriers to access are related to lack of infrastructure as well as to limited financial resources to equip schools with the internet, software and devices. In addition, teachers may not be trained or equipped with the resources to best use these tools in a way that supplements the curriculum. For example, beyond the classroom students might take their devices or programs home in order to continue their learning, but low levels of digital literacy among parents might limit students' ability to use technology effectively (UNICEF, 2020).

Taking advantage of the benefits of ICTs on literacy acquisition necessitates the presence of an ecosystem adapted to both curricula and instruction that supports the digital literacy of both students and teachers. Without such progress, ICTs will be most effective only to a select group, thereby widening the gap (or "digital divide") of inequality and further marginalizing the learning of children at the "bottom of the pyramid" (Wagner et al., 2018, 2022).

Literacy in times of crisis

The outbreak of the COVID-19 pandemic in 2020 has had a serious negative impact on the quality of education globally, and on literacy skills specifically. At the beginning of the pandemic, schools were closed in more than 190 countries, affecting the education of 90% of the world's student population of 1.57 billion (UNESCO, 2021). Overall, about 40% of learners living in remote areas, the poor, linguistic minorities and learners with disabilities in low-and lower-middle-income countries have not been adequately supported during the pandemic (UNESCO, 2021).

Many low-literate and non-literate children, youth and adults (especially women) have been disproportionately hit harder by the educational, social and economic impacts of the pandemic (UNESCO, 2021). In many countries, the response to the pandemic has involved replacing in-person instruction with virtual instruction, such as via TV, radio instruction, or social media to conduct virtual classes (Wagner et al., 2020; UNESCO, 2021). As a result, many countries have not been able to support remote learning, particularly in low-income countries (Vegas, 2020). The pandemic has clearly exposed the lack of preparedness of education systems to shift to distance teaching and learning. Even in places where remote instruction was technologically possible, there remained difficulties in developing pedagogical models and materials appropriate for interactive distance learning (UNESCO, 2020). As such, learning losses in literacy caused by the pandemic are projected to last well into the future (Angrist et al., 2021).

COVID-19 is not the only crisis facing education systems across the world. Save the Children (2021) estimates that the education of around 38 million children is disrupted each year by the climate crisis. As a result, there is a need for retaining and integrating programs that worked well during the pandemic into education systems on an ongoing basis. Such crises naturally result in negative consequences for the promotion of literacy.

Moving forward

In recent years, we have learned a great deal more about literacy and international development. This includes not only the acquisition of reading and writing skills but also more broadly the ways in which individuals communicate, create, and compute across cultures and contexts. Literacy encompasses the tools and competences needed for individuals to develop their knowledge and potential as well as participate in and contribute to the collective. The continuous reshaping of society and the emergence of new technologies have catalyzed the inception of multiple literacies such as information, computer, and digital literacy. These and other skills are create different possibilities of becoming and being literate. A lifespan approach provides a way to conceptualize literacy acquisition as a multidimensional and dynamic process from early childhood through adulthood.

Clearly, there are numerous challenges facing literacy development across the world. Inadequate language policies in low and middle-income countries often act as a barrier to children's journey of literacy acquisition. In schools in Morocco, for example, many children start most of their early schooling years either in a language completely different from their native language (as is the case with the *Amazigh* population) or in their native dialect (*Darija*). While for school children or adult literacy programs, the target literacy is typically in L2 (Modern Standard Arabic). One exception was an innovative and promising project that taught illiterate women who only spoke *Amazigh* to learn to read in that language using the Arabic orthography (Wagner and Maamouri, 2016).

Yet, in numerous multilingual but disadvantaged contexts, students often reach later grades with significant gaps in their L2 proficiency, which in turn affects their learning and academic advancement. The success of multilingual instruction lies in the support resources provided to students and teachers in building a foundation in L1 and then transitioning to L2. Capitalizing on pre-primary education to start L1 instruction, providing students with tailored curricula and books, and providing teachers with adequate training are all tools that research has shown to be effective in ensuring the success of multilingual language policies (Benson and Kosonen, 2021).

Overall, navigating multiple literacies is a common and complex task that requires adaptable language policies to ensure a better transition for children from one linguistic context to the next. When it comes to language policies, there is no one-size-fits-all solution.

With the COVID-19 pandemic still underway (as of this writing) and the emerging climate crisis becoming critical, the pressure on education systems will likely persist well into the future. Because literacy is fundamental for helping individuals and societies to navigate such crises, resilient education systems and practices are needed to ensure literacy acquisition can overcome these new challenges (Wagner et al., 2020).

As noted above, access to ICTs and remote learning is one promising example of how literacy learning can help to address such global problems. The shift to remote learning, which grew dramatically during the pandemic, has proven useful for ensuring the continuity of literacy learning, and led to increased access to ICTs among the poor in many countries. In the long run, governments, international organizations and civil society are finding new ways to leverage education technology innovations (Castillo et al., 2022; UNICEF, 2020b).

The importance and significance of literacy has been increasingly recognized over the years, even as it remains poorly acquired in many parts of the world today. Policy decisions about literacy development will become ever more relevant and more nuanced as societies evolve, and as our knowledge base about literacy continues to grow. The study and promotion of literacy will remain a central aspiration in educational planning and international development for many years to come.

Introduction

In this chapter we discuss and problematize the colonial and contemporary connections between regimes of literacy—including ideologies of writing—and regimes of truth about Africa. This means considering the process of knowledge production, dissemination and reception as politically and economically controlled, contributing to a continuous remodeling of power relations. In the academic realm such power relations have historically characterized the relation North-South, being the North traditionally seen as the spoken subject and the South the silenced object: “the presumption is that people from the North offer through reason the ideas that make people of the South appear. Those from the South, thus, become passive recipients of such light. This, however, is a distortion of history and reality. It erases facts, and it cultivates dependency” (Gordon, 2021: 128). It overlooks the degree to which insights from the Global Souths have even during the period of imperialism been at the core of knowledge production of the Global North (Connell, 2019).

In this chapter we argue for a shift in a geography of reason (Gordon, 2021) that is able to expand the Western-Northern politics of truth that has characterized the production, validation and circulation of what counts as truth. We construe a “shift in a geography of reason” to be a conceptual framework which has multiple dimensions as we try to capture how knowledge about the Global Souths can be framed from a southern epistemological perspective and how and what the Global Norths look like from a perspective of the Souths. Following Makoni et al. (2022) we identify the following as the critical dimensions of a shift in a geography of reason:

1. Shifting from a closed to an open relational commitment
2. Thinking anew and creatively
3. Working on the basis of transindividual rather than isolated subject positions
4. Shifting the sites of the production of knowledge

By situating our arguments in African colonial contexts, we explore the role played by ideologies of literacy, mainly centered on the alphabetic script, in defining what counts as language—taken as fixed and named codes—, which consequently shaped the ideological beliefs about the nature of knowledge production and knowledge transmission which is carried out via extant codes. In African traditional contexts, if it is true that the elderly and ancestors are “the ones who give the first lessons in life, not only through experience but through the medium of stories, fables, legends, maxims, adages, and so on” (Hampaté Bâ, 1981: 179), we argue that such politics of knowledge transmission has been undermined by existing ideologies of literacy, schooling and truth-telling which are in conflict with long held views and practices of knowledge production and transmission. Our argument goes further and we argue that the shift in ideologies about language and literacy also impacted and changed what was regarded as knowledge and what knowledge was regarded as invalid or illegitimate.

This chapter is on literacy in Africa, colonial regime of literacy, regime of truth, authorship, standpoint, politics of knowledge production, oral tradition, politics of citation and editorial politics. The bigger proposition we are making goes beyond simply identifying insights in Africa; rather, we seek to understand how such insights affected the nature of literacy in the Global Norths as well. The critical point we are making is that we envisage “If African identity used to be constructed on the basis of European fictions, other narrative systems might construct it differently, the essential point being that in the future everyone can imagine and choose what makes him or her an African” (Mbembe, 2001: 17).

This chapter is structured as follows: first we briefly present a discussion of African precolonial writing practices; second, we analyze the connections between colonial/contemporary regimes of truth with regimes of literacy; finally, we address the politics of citation as part of the development of epistemologies of the South (Santos, 2014).

The African precolonial writing practices

We conceptualize literacy as a form of social practice tied to specific historical contexts in which it is used and valued. This means that literacy events should be studied “in relation to the larger sociocultural patterns which they may exemplify or reflect” (Heath, 1983: 74). Alphabetic literacy which is linked with formal education is just one instance, though the most powerful, of a situated action upon which the modern nation-state is built. Africa had its own list of literacy regimes and writing practices, some of which are among the oldest in the world (for a discussion see Nwosu, 2010; Juffermans et al., 2014). For instance, the list includes, but not restricted to, the forms of scripts associated with the Egyptian language, namely, the hieroglyphic, hieratic or Cursive, Coptic, and Demotic (Baines, 1983; Makar, n.d, see Fig. 1); Nsibidi which is a pictographic mode in Nigeria (Macgregor, 1909; Nwosu, 2010; Carlson, 2003, Ajibade et al., 2012, see Fig. 2); the Bamum syllabary in Cameroon (Kelly, 2018, Fig. 3); the Vai syllabary in Liberia (Dalby, 1967; Tuchscherer and Hair, 2002; Kelly, 2018, Fig. 4); the Kikakui script used by Mende of Sierra Leone (Tuchscherer, 1995, Fig. 5); the Ge’ez or Ethiopic script in Eritrea and Ethiopia (Asfaha et al., 2008, Fig. 7); Tifinagh in North Africa (Cline, 1953; El Aissati, 2014; Ali and Sedrati, 2016, Fig. 8); the Adinkra in Ghana (Temple, 2010, Fig. 9); the Meroitic script associated with the Nubian Kingdom of Kush in the South of Egypt around the 8th century BC (Griffith, 1913, 1916; Voogt, 2010; Nakanishi, 1980, Fig. 10).

Although most of the scripts above are old, other scripts are relatively recent. For example, Oberi Okaike is an indigenous (religious) script invented about 1930 by Akpan Udofia and Michael Ukpan and is used in the old Efik-Ibibio-speaking area in Nigeria (Akinnaso, 1996). Ismaaniya (Osmaniya) (or Somali script) was invented around 1920 by Osman Yusuf Kenadid, brother of Sultan Ali Yusuf Kandid in Somalia, and another non-Arabic script recently invented in Somalia is the Gadabuursi script by Sheikh Abdurahmaan Sheikh Nuur of the Gadabuursi clan (Lewis, 1958, Fig. 6). In addition to the native scripts listed above, there are also adapted scripts such as the Ajami which is a modified version of Arabic script used for writing in North Nigeria (Akinnaso, 1996).

It should be noted here that when we talk about African literacy traditions we are not just talking about other non-western forms of literacy and the local ways of “decoding” the scripts, but also, and most importantly, we are talking about different graphic modes of “reading the world” in Freire’s sense (2000). In other words, the focus is not exclusively on the linguistic function of these African

writing signs but also on their symbolic sociolinguistic uses (Al-Kahtani, 1996; Suleiman, 2003). For instance, the Adinkra regime of literacy (in Ghana) is not a detached instrument of representing an independent world, it is rather “the rich cultural heritage of using pictorial images to convey the wisdom of Akan life” (Temple, 2010: 127). To take one example from the system, the symbol and meaning of “Sankofa” (going back to roots/the past) in Adinkra (see Fig. 9) is associated with or indexical of the Akan’s philosophy

Symbol	Name	Meaning
	Gye Nyame	Except God. A symbol expressing the omnipotence of God. Probably the most popular Adinkra symbol. It is featured on Ghana's largest-denomination banknote, the 200 cedi note.
	Sankofa	Go back and get it. A symbol of the wisdom of learning from the past to build for the future. From the Akan proverb, "Se wo were fi na wosan kofa a yenkyiri," meaning, "It is not taboo to go back for what you forgot (or left behind)."
	Sankofa	Another Sankofa symbol
	Adinkrahene	King of the Adinkra symbols. A symbol for authority, leadership, and charisma. Also a symbol for qualities associated with kings. Adinkrahene is reportedly the inspiration for the design of the other symbols.

of life (on Sankofa's philosophy see Temple, 2010). It is thus a symbolic way of philosophizing which is historically constituted. Thus, it is by no means an "immobile" resource. Temple (2010) who studies Sankofa as a Diasporan practice in the USA, made the following note which deserves to be cited in full:

Sankofa practice is influenced by several orientations toward African consciousness: (a) as the legacy of natural cultural behaviors documented in its early usage by enslaved Africans who came to the Americas and in later usage, possibly, through epic memory; (b) as resistance with respect to rejecting Eurocentric language and world views and insisting on the relevance of using African conceptual possibilities to define and characterize African life in the contemporary era; and (c) as the symbolic gestures of Diasporan Africans interested in general forms of "returning to the source," or psychological steps toward Africanness. Beyond its usage by Africans, there is also the aspect of Sankofa appearing in non-African space due to cultural borrowing in an age of popular forms of diversity and multiculturalism.

Temple (2010: 128).

To further stress the issue of mobility, it is worth noting that some modern orthographies are developed from ancient African scripts with the purpose to teach currently used varieties of the ancient African languages to both native and non-native speakers not just in the "original" context of the language but also in the West (see Hashim, 2004). To illustrate, the Nubian Language Society (NLS) developed an Old Nubian-based phonemic orthography called "nobiin agii" for teaching Nobiin language to non-native speakers (Khalil, 2021). The NLS, among others, organizes Nobiin courses for non-native speakers in, among other contexts, Sudan, Egypt, and the USA. This and other orthographies are relatively mobile in the sense that they are largely developed and taught in the diaspora (see also Abdulmannan, 2015; for a detailed authoritative review of competing orthographies for writing Nubian languages see Hashim, 2004).

The above examples show that literacies in Africa cannot be conceptualized in purely instrumental terms. The symbolic dimension is always present. The instrumental function of literacy is generally associated with formal schooling or academic literacy, and it marks the shift from orally situated thinking to abstract, and literate thinking, and this shift is considered a defining feature of (western) modernity, and formal discourses associated with scientific disciplines (Street, 1995; Klein and Olson, 2001; Halliday and Martin, 1993). Meaning is viewed as embedded or contained within the word itself. Street (1984) terms this theoretical position the “autonomous model.” The perspective which supports this function is known in the literature as the “Great Divide” and is generally associated with the writings of McLuhan (1962), Goody and Watt (1968), Ong (1982), and Olson (1977) (for a review see Street, 1984; Klein and Olson, 2001). Alphabetic literacy has determined a significant portion of metalanguage which we use to convert language from a situated practice to an object of study; however, the cognitive implications drawn by the theorists of the Great Divide between orality and literacy are not universal. The use of these modes of communication is determined by their roles, goals, and learners’ needs in a society, though one mode may historically receive more emphasis than another (Al-Kahtani, 1996). For instance, although standard Arabic is largely associated with writing, it is conventionally used in specific communicative events as the default mode of expression (Ferguson, 1959). So, what determines the use of a highly codified medium is the context of situation and not the nature of the medium itself.

Connecting colonial and contemporary regimes of truth with regimes of literacy

In this section we aim at exploring the interconnection between the colonial regime of literacy and contemporary knowledge control mechanisms. The concept of regime of literacy (Kalantzis and Cope, 2015: 16) includes a political perspective that considers the “roles, rules, structures of governance and disciplinary logics” underlying the idea of literacy taken as a “regime of epistemic discipline, a moral economy.” We conjugate such idea with the discussion on how colonial regimes of truth (Foucault, 2003) about Africa contributed to invent an idea of Africa (Mudimbe, 1988). By regimes of truth we consider the types of discourse considered as truth to each society. In other terms, it is related to how each society forges specific ways of saying and validating its truth. Foucault (2003) identifies in Western societies five traits that characterize its regime of truth: (a) its relation with the scientific discourse; (b) its subjection to economic and political interests and forces; (c) its relation to a politics of diffusion and appropriation; (d) its relation with specific politics that regulates the way such discourses are distributed and institutionally validated; and (e) its relation with ideological struggles. In a nutshell, “truth is to be understood as a system of ordered procedures for the production, regulation, distribution, circulation and operation of statements” (Foucault, 2003: 132).

We argue that the regimes of truth about Africa were largely framed by specific discursive genres that also contributed to outline both the idea of what counts as language (Abdelhay et al., 2020; Gilmour, 2007; Makoni and Pennycook, 2006) and the discursive modes of expressing the truth about Africa (Severo and Makoni, 2020). Such discursive genres are based on the written word and its ideological role (Weth and Juffermans, 2018) that contributed to shape the ideas of language, knowledge transmission and truth. We argue that this scriptist logo-centric nature of knowledge has promoted particular types of knowledges and denigrated others. Examples of such ideologies based on the written word are missionary Linguistics and the schooling language ideology. We argue that there is a connection between concepts of language and the way the truth about Africa has been told and legitimated since colonial era until contemporary academic practices.

The tyranny of writing and the hegemonic ideology of alphabetic literacy

The introduction of alphabetic literacy in African contexts contributed to shape not only an ideology of language (Makoni and Meinhof, 2004), but to hierarchize languages and language practices in terms of the notions of prestige, citizenship, development and modes of telling the truth about Africa. We engage with the concept of “tyranny of writing” as a critical framework that contributes to elucidate the emergence and crystallization of “tensions and contradictions between the written and the spoken word, linguistic normativity, creativity and authenticity, and centers and peripheries in language practices” (Weth and Juffermans, 2018: 1). In this chapter we do not discuss the several concepts of literacies that have been under revision and expansion by the so-called New Literacy Studies (Street, 1984); rather, our objective is to elucidate how regimes of truth have contributed to reproduce language ideologies oriented by written scripts:

[the] ideology of literacy has significantly contributed to the construction of a particular “image” of Africa (imagined by this model of literacy as a bounded continent). By focusing on the cognitive (in)ability of a person to read and write, this ideological scheme of classification constructs what counts as “a normal person” (read: “modern”) in the process. The Eurocentric image of Africa is largely constructed through the variants of this technical discourse (i.e., a monolithic discourse on “literacy in Africa”).

Abdelhay et al. (2014: 2).

Such language perspective centered on ideologies of literacy has contributed not only to undermine what can be called as oral tradition in African contexts, but also to underestimate the role of African languages—and African discursive genres—in telling the truth about it. By inquiring about colonial and contemporary regimes of truth about Africa we draw attention to the role played by orality in shaping a sense of personhood (Wiredu, 2009: 13): “the influence of orality in philosophy need not be always negative. In

truth, sometimes an oral habit may be loaded with wisdom [...] this is so with regard to the African conception of a person." In this line of thought, we also consider that "Where writing does not exist, man is bound to the word he utters. He is committed by it. He is his word and his word bears witness to what he is" (Hampaté Bâ, 1981: 167). By problematizing how colonial and contemporary regimes of truth have been reinforced by specific regimes of literacy and vice versa, we spotlight the ethical and political dimension of such discussion.

Orality and the testimonial narrative

In the context of literary discursive regime, the testimonial narrative has been aesthetically recognized as a form of report of post-war survivors, whether in Europe, Latin America or Africa. As a discursive genre, "O testemunho, como sabemos, tem uma conotação política muito marcada que se traduz em permitir o uso da palavra por aqueles que tradicionalmente se encontram excluídos" ["The testimony, as we know, carries a marked political connotation by allowing the use of the word by those who are traditionally excluded"] (Reis, 2007: 79). We mention this as an example of discursive memory construction pervaded by the experience of historically invisible and silenced witnesses whose testimony has been transmitted across generations, helping to build a sense of truth. This means recognizing that "não se pode fazer uma história válida dos povos africanos sem a tradição oral" ["one cannot make a valid history of the African peoples without the oral tradition"] (Ki-Zerbo, 1969: 123). The testimonies have been used as central elements in the reconstruction of another history about Africa in which local voices work also as authors of such narratives. In this regard, Hrbek argues in favor of the reconstruction of South African history (1981: 124) from the perspective of "African voices":

the struggle now going on in South Africa in every field of human activity necessitates also a new approach to the sources; particular attention must be paid to the written evidence of the hard struggle of the Africans for their rights. Only research based on all the evidence and material will allow the writing of a truthful history of South Africa.

By discussing the role of oral tradition, testimony and personhood in the construction of narratives about what counts as Africa we also intend to problematize the Western and Northern regime of knowledge production. Such regimes of truth have been allied to regimes of modes of telling-writing which contributed to largely dictate the rules that determine not only the production of knowledge and its economic and political value, but also the language ideologies that frame the way we (Southern scholars) are supposed to tell-write the truth about Africa. We claim that contemporary scholarship has contributed to perpetuate colonial ideologies of literacy that overlaps ideas of knowledge, knowledge transmission, language and truth mainly centered not only on alphabetic literacy, but also on academic discursive genres broadly regulated by the academic publishing industry.

Authorship: who is authorized to speak?

In this sense, the concept of authorship regarding who is legitimated to tell-write about Africa also matters. Taking into account an ethical approach to this issue, we consider two interconnected elements: the individual and the collective dimensions of authorship, both referring to a given discursive function (Foucault, 1977) or standpoint (Hill, 2000). As a function of discourse, authorship refers to discursive memories and interpretive frameworks; it is concerned with how discourses are controlled, selected, organized and classified, which is strongly influenced by the material and political conditions underlining such discourses: "the function of an author is to characterize the existence, circulation, and operation of certain discourses within a society" (Foucault, 1977: 124). Similarly, the standpoint cannot be reduced to an individual's perspective, but is signals to specific modes of discursive functioning that is strongly connected to collective modes of living and interpreting the world: "Black women intellectuals have laid a vital analytical foundation for a distinctive standpoint on self, community, and society and, in doing so, created a multifaceted, African-American women's intellectual tradition" (Hill, 2000: 2–3).

The academic regime of knowledge reinforces a given authorship functioning based on politics of citation and editorial positions that tend to prioritize certain proper names—generally white men from the Global North—that work within neoliberal statistics of citation in which white men tend to cite other white men, research groups favor their peers, and the references tend to reproduce the same Eurocentric cadre of scholars (B. Makoni, 2021; Mott and Cockayne, 2007). Also noteworthy is the priority given to the English-speaking academic community, or to the translation and proofreading industry for English texts. For example, more than 90% of the information available in international databases, such as the Science Citation Index is in English, which attests that the language policy that guides the scientific and academic truth regime is based on use of the English language, on rhetoric and Anglo-style and on symbolic representations about language (Kirkpatrick, 2009). This fact matters when we think about the importance of the authorship from the Global South in the system of production and dissemination of knowledge to foster anti-racist, anti-sexist and geopolitically plural academic practices. In other words, attention to the citation interferes in the economy and geopolitics of knowledge itself:

Careful and conscientious citation is important because the choices we make about whom to cite—and who is then left out of the conversation—directly impact the cultivation of a rich and diverse discipline, and the reproduction of geographical knowledge itself.

Mott and Cockayne (2007: 955).

By connecting the discussion on regimes of truth and regimes of literacy, we intended to problematize the political framework that has defined and hierarchized concepts of language, ascribing to alphabetic writing and academic written genres not only social prestige, but also the power to tell-write the truth about the South and Southern people. We will problematize such aspect in the next section.

The African decolonial burden: the politics of citation and the southern voice

On the June 15, 2021 we submitted a manuscript entitled “The Discursive Politics of the Sudanese Revolution of December 19, 2018” for consideration for publication in the *Journal of Multilingual and Multicultural Development* (JMMD). On June 17th (after two days from the submission date), we received the following email from the General Editor of the JMMD, Professor Jean-Marc Dewaele:

Dear Dr. Abdelhay,

I regret to inform you that we have now considered your paper, but unfortunately feel it unsuitable for publication in Journal of Multilingual and Multicultural Development. You are now free to submit your manuscript to another journal.

Thank you for considering Journal of Multilingual and Multicultural Development. I hope the outcome of this specific submission will not discourage you from the submission of future manuscripts.

Yours sincerely,
Professor Jean-Marc Dewaele.
Editor.

Upon the receipt of this email, we responded with the following email (dated June 20, 2021):

Dear Professor Jean-Marc Dewaele,

Thank you for your email. We are disappointed with this editorial decision for two reasons, first because we are not told precisely the reason for not considering the paper for reviewing. It could have been very helpful had you told us about the reason. Second, the document of “Author’s Guidelines and General Information” which you attached also left us in the dark about the ground for your editorial decision. As we see it, our paper ticks three boxes: ethnicity and nationalism (the paper is about the December Revolution in Sudan, which it mainly addresses the issue of agency and gender in context of conflict); identity politics (the paper is framed from within the cultural politics to consider how language and identity in the context of the revolution are sites of conflict and struggle in Sudan); popular and folk sociolinguistics and usage (one of the fundamental goals of the paper is to critique the eurocentric discursive construction of the revolutions, and that is why we have used cultural politics as a framework to explore folk sociolinguistic constructions of the ‘same’ event); collective identity and its markers (to show markers of the different voices or identity we performed micro-analysis not as an isolated activity but as a way of addressing the wider issues referred to above). So we wonder how concretely our paper is “unsuitable for publication” in this journal if it addresses these required conceptual boxes?

This is not our first submission to the journal on a cultural politics of language in Sudan, we have published at least two papers on Sudan in this journal dealing with the politics of language, and this manuscript is part of our wider project which deals with the cultural politics in Sudan and other contexts. We are mentioning this point as a way of saying we cannot see a reason in the attached document for your editorial decision nor any ground for your statement that the paper is “unsuitable for publication.”

Since the Guidelines advise that if authors are unhappy about an editorial decision they can contact Professor John Edwards, we have cited him in this email.

Yours,
Ashraf Abdelhay (for Cristine Severo and Sinfree Makoni).

The Editor Jean-Marc Dewaele returned on 20 June with the following response:

Dear Ashraf (and co-authors),

I understand your disappointment about my decision not to send your paper out for review. The fact that your paper ticked the boxes did not automatically qualify it for being sent for external review. I noticed that the authors are respected scholars, and that the paper seemed well constructed. Also, I love contributions about Africa. However, I judged that this paper was unlikely to attract a high volume of future citations and my job as editor of JMMD is to boost its impact factor. You may disagree with me, and I fully understand, but in my 6 years as editor of IJBEB, I managed to double its impact factor, and I intend to do the same for JMMD.

I’m surprised John Edwards is still mentioned in the guidelines, as he is now Reviews Editor rather than General Editor, but I welcome his opinion in this matter!

Regards,
Jean-Marc Dewaele.
Editor Journal of Multilingual and Multicultural Development.

We responded to the email of Professor Jean-Marc Dewaele on 21 June with the following email:

Dear Professor Jean-Marc Dewaele,

We thank you for your transparency. We should let you know upfront that the linguistics we operate with, whether at the level of theory or practice, is precisely a negation of your editorial linguistic ideology. You are right that you might have succeeded in boosting the “impact factor” of the

International Journal of Bilingual Education and Bilingualism (IJBEB) and you might achieve the same “success” for the JMMD, but in the process of boosting the journals’ statistics and your editorial CV, you have effectively excluded and silenced “less known” scholarship from the Global South including the “voices” of the masses in the Arab world and Africa. If the default definition of sociolinguistics is the study of language as it is used by people on the ground (whether in Liverpool or Dongla in Sudan), the linguistics you are promoting through your editorial practice is Eurocentric to the core because it “erases” from view less known forms of (folk) linguistics outside Europe, let alone works which can be classified as “anti-linguistics.” It should have occurred to you that this understanding of the “impact factor” which leads an editor of a multilingual and multicultural journal to pre-determine whose voice should be heard is itself an effect of ideological practices such as yours. And the result is a corpus of monocultural and monolingual voices constructed through epistemological spaces paradoxically intended for the recognition and development of multiculturalism and multilingualism. This is the goal of JMMD as we understand it. Its goal is not to enhance its statistics of the impact factor at the cost of excluding “less known” works about less known sociolinguistic situations and topics. Otherwise, the journal should indicate this condition in the Guidelines which you shared with us, i.e., it should state that “potentially less citable work” will be deemed by the editor as “unsuitable for publication.” The process of peer reviewing which is the principle of validating knowledges in journals has now at your editorial hand become redundant for works which you believe (as part of your ideology) is (potentially) less cited. What is striking here is that you have even determined the future trajectory of “less known works” if they are published by the journal. And that is why with “confidence” you disqualify them from the very beginning as “not suitable for publication”! This metaphysical ideology is exclusionist because it effectively silences “less known” voices from the Global South using a politics of citationality to rationalize this symbolic violence. And worse, it reflects a particular (mis)understanding of knowledge as a quantifiably static “thing” whose trajectory can linearly be predetermined and known even before it is circulated or perceived. The question of “how” (how it will be perceived, and the effect it may produce on existing literature, etc.) is effectively erased. “Less known” works are not born “less known”; they are constructed as such through specific discursive planning practices including editorial policies and practices.

We know very well that publishing is a field of power (in Bourdieu’s sense). This is understandable, but it becomes an unfair game when a journal is gated by pre-judgmental editors against “less known” works and knowledges from Africa and the Middle East. However, this process becomes fair when editors grant “less known” works or contributions which deal with less “popular” topics, which tick the boxes, the opportunity to be heard (to be reviewed); to be treated objectively equally with other “works” from the Centers. We experienced this fair editorial practice by Professor John Edwards.

We will of course submit our paper to another journal, and we will make sure you are not its editor or “co-editor” simply because we can now expect the fate of our work or the works of colleagues from the Global South if you are the editor. Parallel to this process, we will continue our epistemological and “ethical” struggle against exclusionist practices in academic discourses and institutions, and we intend to take the case to the publishing house (Taylor and Francis). Our objective for pursuing the case further is, as we said, ethically motivated: If such an editorial practice is normalized as a policy, it will certainly have adverse consequences on scholars and scholarship from the Global South and other “less known” sociolinguistic contexts.

Yours,

Dr. Ashraf Abdelhay (for Dr. Cristine Severo and Prof Sinfree Makoni).

As an action-oriented step to change this editorial ideology, we filed a formal complaint to the publishing house (Taylor and Francis), and we cited the exchanges above in the light of which we contended that:

In the light of the above editorial justification of Professor Jean-Marc Dewael, we evidently believe that his editorial practice is discriminatory and exclusionist of scholarship from unknown sociolinguistic situations from Africa and the Middle East. The Editor admits that the paper is well constructed and written by established scholars and that its content ticks the boxes indicated in the Guide of the journal; however, he rejects to subject it to reviewing because he believes that it is not potentially citable. This justification is not “scientific” and we have never heard of it as a condition for publishing in a journal. As the Philosopher Karl Popper noted, scholarship proceeds by falsification from the margin, i.e., unknown cases can change the intellectual landscape. Most importantly, our paper is about the Sudanese December Revolution of 2018, which is a very recent development, and having it excluded from consideration for publication because it is relatively unknown context means excluding the contribution of local material-discursive situations to our understanding of mainstream concepts and theories which we use to understand those dynamics. Thus, we have an objective ground to believe that we have been unfairly discriminated against by Professor Jean-Marc Dewael because the work is from Africa.

We kindly ask that our complaint against this exclusionist and discriminatory editorial practice be given due consideration otherwise scholarship about new or unknown sociolinguistic conditions from Africa and the Middle East will be systematically marginalized and excluded by the journal.

Citation is the textual act of referring to another work as a way of recognizing the contribution of others in the process of knowledge production. And the impact factor is calculated as “the number of citations to papers published in a particular journal over a 2-year period divided by the total number of papers published by the journal in those 2 years,” and the purpose is that “this metric provides a standard through which librarians can compare journals to help in making decisions for purchasing subscriptions” (Marks et al., 2013: 611). It was never intended as a measure of the scientific quality of a research paper in a journal.¹ With this very precise scope in background, we can understand the “misuse of journal impact factors in scientific assessment” (to employ Marks et al., 2013 title). The above tabulated transcript is a real case of misuse of the impact factor by an editor of an established journal.

Our aim for citing the above institutional interaction with the editor of the JMMD is to show with concrete example how the issue of the “citation rates” in academic journals, which is the basis of calculating the “impact factor,” can be manipulated as a proxy for exercising epistemological racism against scholarship and scholars from the Global South. It is a way of raising the question of how our thinking about language and society has become so colonized by conditions such as the “citation rate” when it is pursued by journals as an end in itself, and the impact of this style of thinking on scholarly debates and on the limits of what Gordon (2021) terms the “geography of reason.”

Citation is a key metalinguistic device which forges a sense of collective construction and shared ownership of knowledge. However, it is simultaneously implicated in the cultural politics of stratification particularly when it is (ab)used in the academic discourse as a gatekeeping tool of excluding non-mainstream scholarship or works by writers of color or LGBTQ which deviate

¹San Francisco Declaration on Research Assessment, <https://sfidora.org/read/>.

from the established frame of conceptual expectations (Scharrón-Del Río, 2020). Marks et al. (2013), the editors of the *Journal of Traffic*, made the following significant observation:

Many investigators use the JIF [journal impact factor] in deciding where to submit their work for publication, opting to submit to “high impact” journals over journals, which though more appropriate, have a lower JIF value. More insidiously, many academics, employers, funding agencies and others, across the world have come to use the JIF of journals in which individuals publish to make decisions about hiring, academic promotion, funding, etc. Rather than judging the value of a paper based on its significance and the quality of the work presented, or judging our peers based on the aggregate of their individual merits, we judge them based on the average number of citations received to papers published in journals in which they publish. Publishers and editors of the journals themselves have taken note of this trend, and anxiously await the release of the journal JIF every June; many journals “game” the JIF by opting to favor publishing article types that tend to accumulate citations or by classifying some articles that will be cited by others.

Marks et al. (2013: 611).

Similarly, in the context of the Arab world, Amin (2021) noted that the main objective of research is no longer the production of scientific knowledge and the development of society through participation in policy making, but rather publishing in journals with a high impact factor. He added that researchers from the Arab world were consequently discouraged from working on issues related to their socio-political situations because “those in charge of these journals will most likely reject articles that will not achieve enough citations, thus weakening the impact factor of the journal” (Amin, 2021: 99). They were also enforced to abandon discursive methodologies, since high impact-factor journals favor positivist ones.

The editorial perspective in the example which we cited above shows how a particular editorial regime of textual rationality can render southern scholarship invisible by denying publishing works related to or published by scholars from the Global South. The discursive mechanism for this editorial act of erasure is the ideology of what counts as “a potentially citable work.” This institutionally supported Eurocentric and Orientalizing gaze becomes a grid for deciding what is “potentially citable” because it operates from within a monoglossic ideology of knowledge. Crudely, in some academic journals, the “citation rate” is both an effect and a proxy for peripheralizing the southern voice. This cultural politics of citation has serious implications and ramifications for scholars from the Global South including black female scholars (B. Makoni, 2021). For example, it disqualifies other historically situated epistemologies simply because they, as the above editorial position believes, cannot boost the impact factor of the journal and consequently the “CV” of the editor. In a paper entitled “bibliometrics as weapons of mass citation,” Molinié and Bodenhausen argued:

The allocation of resources for research is increasingly based on so-called “bibliometrics.” Scientists are now deemed to be successful on the sole condition that their work be abundantly cited. This world-wide trend appears to enjoy support not only by granting agencies (whose task is obviously simplified by extensive recourse to bibliometrics), but also by the scientists themselves (who seem to enjoy their status of celebrities) ... the overwhelming fashion of bibliometrics is largely due to the narcissistic mind of the scientists themselves. Their fascination for citation indexes often drives them beyond reason. Their obsession with their egos is much more perverse than the laziness of granting agencies.

Molinié and Bodenhausen (2010: 78).

We argue that although the above communicative process was with an individual scholar invested with editorial power, the encounter reveals structural pattern about what “counts as legitimate knowledge” within the hegemonic western regime of literacy and textuality. In other words, although the epistemic position of the editor is not shared by all western sociolinguistic journals and not even by members in its editorial board (who are normally denied voice), it is still systemic and hegemonic (for a discussion of the technical defects of the impact factor see Ramsden, 2009; Kiesslich et al., 2021). Afful and Janks (2013: 193) rightly argued that there “can be no doubt that citation in the academy is a politicized practice. In acquiring advanced academic literacy, students have to master the art of positioning themselves in relation to the work of others, so that they develop their own ‘scholarly identity’”. Thus, citation practices enact “in-built hierarchy of privileged academic sources,” and they define what counts as “knowledge” in a particular community of practice (Afful and Janks, 2013: 196). Reflecting on the systemic perpetuation of racism and sexism in the process of knowledge construction, B. Makoni (2021) argued that

gendered racial injustice is seen in publication rates, citation rates, and appointments to editorial boards. The underrepresentation of women in general, and black women in particular, discursively constructs scholarly enquiry as normatively white and masculine. The exclusion of nonwhite scholars partially emanates from a reliance on Euro-American theoretical frameworks that are applied, often uncritically, in other contexts as if the Euro-American experience were universal. The result is scholarship that is incongruous with local experiences and practices.

B. Makoni (2021: 48).

The result of processes of editorial erasure of the southern voice is an institutionalized construction of an “apartheid of knowledge in the academia” (Bernal and Villalpando, 2002). To drive the discussion home, journals which exclude works from/about the

Global South using the “citation rates” as an editorial rationalization, run the risk, in the words of B. Makoni (2021: 50), of “reproducing the power relations it critiques if the racialized relations that impact the global flows of power and knowledge remain unquestioned.”

It is worth stressing that some journals and editors have rejected this misuse of the JIF. At the 2012 meeting of the *American Society for Cell Biology* (ASCB), some editors of bioscience journals discussed the misuse of impact factor and suggested a number of recommendations to stem this misuse. The set of recommendations and the concerns became known as the “San Francisco Declaration on Research Assessment” (<https://sfdora.org/read/accessible> March 23, 2022). The “General Recommendation” made by the declaration reads: “Do not use journal-based metrics, such as Journal Impact Factors, as a surrogate measure of the quality of individual research articles, to assess an individual scientist’s contributions, or in hiring, promotion, or funding decisions”.

Some sociolinguistics-oriented journals and editors also seriously started to widen its geography of reason by diversifying its editorial board and actively supporting and encouraging research from the Global South, and giving visibility to non-western languages. Ernst (2010: 90) suggested the creed of “discrediting ‘number games’ as incompatible with our goals of objectivity, credibility, fairness, and social responsibility, as researchers,” and called for establishing “on the Internet, a generally accessible Webpage to list agencies, journals, and individuals who regularly use and misuse bibliometric measures in their judgements.” He further argued that: It is only by this kind of active resistance to the follies of bibliometrics that our scientific self-respect and credibility can be saved. We should liberate our minds again to enable true creativity in view of long-term social benefits: “We certainly do not want to convert our precious universities into bureaucratic training centers for mindless citation hunters! Our institutions shall remain forever unbiased resorts of limitless human dignity and foresight” (Ernst, 2010: 90).

Concluding remarks

This chapter makes a case for the interconnection between the concept of authorship, the politics of knowledge production—which includes the politics of citation and impact factor—with the discussion on (colonial) literacy in African contexts. This means that the rules that dictate the discursive production of truth in Western societies are deeply inscribed into specific ideologies of literacy. From a historical and critical perspective we problematize such regimes of truth (Foucault, 2003) and “geography of reason” (Gordon, 2021) that have framed our understandings of language, writing and truth-telling in the academic field. Finally, concerning the ideologies of literacy and the politics of knowledge production on Africa, we follow Gordon’s (2021: 69) challenges regarding a shift in the geography of reason:

Shifting the geography of reason requires understanding that power should not be reduced to a single element but instead should be explored to its creative potential. If we acknowledge power as the ability to make things happen and securing access to the conditions of doing so, there is much proverbially to be done.

Colonialism and coloniality in Latin America

After the “Conquest,” or European invasion, of the Americas, a process called *colonialism* started in this part of the world. Colonialism is the process of dominance of the European sovereignty over the non-Western people who occupied the territory before the invasion (Kohn and Reddy, 2017). Spaniards and Portuguese dominated the region known now as Latin America, which goes from Mexico to Argentina. However, Latin America is not only a geographical region, it is also a “historical experience” consequential of the project of colonialism (Quijano, 2000). Anibal Quijano (2000) identifies two important elements that determined modern societies in Latin America: first, colonialism imposed new forms of labor based on capital that were the foundation of new patterns of power; and second, the idea of “race” was created to establish a hierarchical difference between the dominant and the dominated based on physical ideals and also human capabilities, such as reason and humanity (Walsh, 2010).

With the introduction of these two elements, new social identities were formed: “Spanish,” “Portuguese,” “Indians,” “Negroes,” and “Mestizos”. The idea of race was used to position people in the power structure of the new society; this division determined the division of labor and who was in control of the resources (Quijano, 2000). Whiteness was associated with power, control and domination; for instance, white people were the only social stratum who could receive a salary. The Latin American genocide was also based on race; during the invasion and colonial times millions of Indigenous and African descendants were killed because of their race (Menéndez, 1972). This system of domination has been known as the *coloniality of power*, grounded in the relationship between race, capitalism and colonialism (Walsh, 2010). While *colonialism* is a political, intellectual and historical process, *coloniality* is the pattern of power used since colonial times (Walsh, 2010). The coloniality of power is also part of the project of modernity, where knowledge was adapted to the needs of capitalism (Veronelli, 2015). In this project, objective reasoning is privileged over other forms of knowledge, and Indigeneity was converted into a problem, “the indigenous problem” (Walsh, 2010). Those who were “colonized” were considered as less-human, and their knowledge and language as less rational or not even human (Quijano, 2000).

As mestizos, who were born from Spanish men and Indigenous women, gained more privileges and power, they wanted to distance themselves from the Indigenous and African culture and aspired to become Europeans (Walsh, 2010). For that reason, *mestizaje* has also been described as a physical and cultural whitening process (Wade, 1997). Through time, *mestizaje* became a discourse of power. After the independence of the Latin American countries, the coloniality of power continued. The new countries depended financially on Europe, and they still aspired to be like Europe (Quijano, 2000). In the 19th Century, the mestizo discourse built stronger as emergent states started the formation of their national identities (Walsh, 2010). In the 21st Century, Latin America still experiences the lasting effects of coloniality and the coloniality of power.

Literacy as a form of domination during colonialism in Latin America

Before the arrival of Europeans to the Americas, approximately 1400 Indigenous languages, or Amerindian languages, organized in 123 linguistic families, were spoken in Latin America (Wagner, 1991). With slavery, other African languages came into contact with these Indigenous languages during colonial times, creating contact languages or creoles, such as the *criollo palenquero* in Colombia (Patiño Roselli, 2002). In addition, Spaniards spoke different Spanish dialects since they came from different territories in Spain, such as Andalucía, Castilla and Extremadura (Marimón Llorca, 2020). In face of this linguistic diversity, one of the main colonialism

projects was the erasure of linguistic diversity in order to eliminate Indigenous and African cultural identities. As a result, in the 21st Century, only around 160 Indigenous languages are spoken in Brazil, 140 in Peru, 70 in Colombia and 68 in Mexico. In this way, particular cultural identities such as those of the Quechuas, Chibchas, Aztecs, Mayas, Incas, etc. were reduced to a single racial category: "Indians" (Quijano, 2000).

Some of the Amerindian groups possessed an important literary tradition in pre-Columbian and colonial periods. For instance, the Aztecs and the Mixtecs had hieroglyphic writing and the Mayans had a systematic writing system (King, 1994; Wagner, 1991). Part of the colonialism project of cultural extermination included the prohibition of all forms of literacy in Amerindian languages. As a consequence, in many Indigenous groups, "writing is associated with the official and dominant language, Spanish, and, by extension, with schooling" (King, 1994, p. 2).

Colonialism equated literacy in the dominant language with knowledge and power. Spanish and Portuguese missionaries were in charge of the process of acculturation and assimilation of the Indigenous communities through education. Since the 17th Century, the Western European version of rationality was imposed as one in which "the 'inferior' 'races' are 'inferior' because they are 'objects' of study or of domination/discrimination, they are not 'subjects', and, most of all, they are not 'rational subjects'" (Quijano, 2000, p. 221). This idea grounded the ideology that non-Western people in the Americas needed to be "civilized".

This civilization process involved a process known as the *coloniality of language*, a dimension of the dehumanization process through racialization of "colonized" people (Veronelli, 2015). The Western idea of language was that only civilized populations could express knowledge through language and literacy (i.e., people who spoke Spanish and Portuguese languages, which had Latin roots). The consequence of the coloniality of language was that Indigenous and African descendants were considered as unable of dialogue. When Indigenous and African descendants learned Spanish or Portuguese, it was not with the intention of having a dialogue with them, but that they could follow orders and understand instructions (Veronelli, 2015).

The mechanisms of coloniality: missions and literacy campaigns

With these ideas in mind, various religious missions were sent to the Indigenous communities with the purpose of evangelizing and civilizing the native peoples. One example of this process was the Capuchino mission to the Sierra Nevada de Santa Marta in Colombia, where members of the Capuchino religious congregation established in the community to educate Arhuaco peoples into the dominant language and culture since 1916. After several complaints made by the Indigenous population and a long political struggle, the Capuchinos were expelled from the territory in 1982 (Duarte, 2018).

With the massification of education during the 20th Century, in the 1940s some Latin American governments (such as Ecuador, Dominican Republic, Mexico, Honduras, Guatemala, and Peru) instituted the literacy campaigns, aimed at reducing illiteracy rates across the countries (Rodríguez, 2009). In 1947, the United Nations Educational, Scientific and Cultural Organization (UNESCO) determined that "fundamental education" and basic literacy should be included in the development goals of the following decades in the region. However, during the 1940s and 1950s, literacy campaigns had a focus on Spanish and Portuguese as dominant languages and the development of basic literacy skills not as a means of liberation, but as a requirement to function in the dominant society or to "civilize" the "ignorant". During these decades, the literacy campaigns functioned in line with the dynamics of the coloniality of language.

Now that the two concepts: *coloniality of power* and *coloniality of language* have been introduced and explained in the Latin American context, we will present how literacy has become a form of resistance to these processes: a "decolonial" turn.

Literacy as a form of resistance in Latin America

... Soy lo que dejaron

Soy toda la sobra de lo que se robaron ...

Soy América Latina

Un pueblo sin piernas, pero que camina

Calle 13 (2011).

Domination, however, is not the "single story" (Adichie, 2018) of Latin America. The popular song *Latinoamérica* by Calle 13 (2011) reflects in a few words how the "remains" left by the European invasion did not stop the Latin American peoples to continue moving forward and resisting the consequences of coloniality. If Indigenous and African descendants were considered as unable of dialogue, it is through dialogue or dialogic expressions that Latin American communities have resisted the coloniality of language

(Veronelli, 2015). For instance, through: (a) dialogic pedagogy, as an act of sharing realities and seeking liberation among subjects under horizontal conditions; (b) transmodernity, as a process to overcome post-modernity, which is focused on European culture, and to highlight the potential of aspects outside of Western modernity, such as knowledge and practices that have been excluded by hegemonic models (Dussel, 2004, 2005); and (c) interculturality, as an appreciation of diversity in multiple contexts, including the cultural and linguistic identity of each subject and the idea of disposing homogenization processes (Bertely et al., 2015; Tinajero, 2010; Tinajero and Englander, 2011; Walsh, 2010).

Dialogic pedagogy pretends to transform oppressive situations derived from the processes of colonialism and coloniality through critical dialogue and critical consciousness (Freire, 2018). Literacy, in its multiple forms, can become a form of resistance when it is part of decolonial action. That is, when people engage with literacy practices in ways that recognize the geopolitics of knowledge, seeks to dismantle relations of coloniality in its material and discursive forms, and is used in the service of land repatriation and human rights (Tuck and Yang, 2012). One example of these processes are the literacy crusades in Cuba in the 1960s and Nicaragua in the 1980s, characterized by “the mass involvement of the people, and the commitment of time and resources at the national level” (Osborne, 1990, p. 2) to achieve social transformation and empowerment. Further, there is a long lineage of multi-literacies scholarship in Latin American which has resisted autonomous models of language and literacy (e.g., De la Piedra, 2009; Kalman and Street, 2013; Trigos Carrillo and Rogers, 2017; Zavala, 2002).

In the following section, we describe some Latin American initiatives and forms of resistance to the coloniality of language, acknowledging that many of them intersect with the three perspectives mentioned above. We do not pretend to be comprehensive, but to provide representative and innovative initiatives that work against the coloniality of language while we also recognize that a long path still needs to be walked to dismantle the effects of the coloniality of language and power in education.

Educación Propia: a dialogic educational system

Schooling has served as the main source of “acculturation” of native communities from colonial times until today. In general, schooling was not only used to force a new language into Indigenous communities, it also imposed a way of thinking, a more vertical view of the relation between school and communities, where teachers were seen as “the experts”, promoting authoritarian relations between teachers and students (Molina and Tabares, 2014). These vertical attitudes did not allow room for more dialogic relations between teachers and parents, which work against communal participation (CRIC, 2004). It is natural, then, that schooling has also become central to Indigenous struggles against the disappearance of their culture, language, and identities.

The notion of *Educación Propia* (translated as *own education* in Colombia and *differential education* in Mexico) is found across different Latin American countries as a pillar in their struggle for permanence. In Colombia, this concept emerged in the mid-seventies, as an initiative of the Consejo Regional Indígena del Cauca (CRIC), with the purpose of creating educational strategies to ensure cultural strengthening and survival. At that point, the national government and the Catholic church were in charge of education, which was not always in favor of the Indigenous communities’ interests. Bolaños and Tattay (2012) posited that the school could not continue being a space of disintegration and weakening of the cultural identity, so they sought to turn it into a strategy for the foundation, reconstruction and permanence of cultures. González (2012) adds that the traditional/modern school contributed to the discrimination and lack of recognition of the Indigenous identity.

Educación Propia emerged as a response to these claims, opening significant spaces for dialogic encounters in three main areas: (a) a dialogue between school and community, which strengthens a sense of belonging: the school belongs to the community; therefore, it becomes the core of the struggle of the people, a tool for awareness and organization (CRIC, 2004). This also includes a powerful encounter between the elderly and the younger generations; (b) a dialogue between Indigenous languages and Spanish, revitalizing the character of Indigenous languages as knowledge builders, and turning them into adequate means to build new knowledges, and establishing dialogues from a strengthened identity, whose interest is that both, the Indigenous language and Spanish, are appropriated adequately in their role of vehicular language and revitalize their own ways of communication in their bilingual character (Bolaños and Tattay, 2012); and (c) a dialogue between Western and local epistemologies, allowing places of intersection where mainstream systems (e.g., research processes, notion of higher education) would be adapted to meet the diversity and cultural needs of the communities, with the consideration of local knowledge and beliefs as fundamental basis for building new knowledge.

Cauca is a key example of resistance in Colombia (González-Terreros and Torres-Carrillo, 2020), however, it is not the only one. Other Indigenous peoples in the country have also led processes of empowerment and transformation in their literacy practices to make sure they can survive as they dialogue with mainstream epistemologies. The Arhuacos, in the region of Sierra Nevada de Santa Marta, have used language planning (*planificación del lenguaje*) (Fishman, 1991) to sustain and revitalize their Ika language even with the pressure of Spanish over their communities (Murillo, 2006). Through the approach of Educación Propia, they have transformed national educational policies into more relevant practices that include their traditions, needs, uses and customs, adequate for their cultural ethnic diversity. For instance, they have defined the Institutional Educational Project (PEI for its name in Spanish), which is mandatory for all schools across the country, as a Community Educational Project (PEC) (Poche Cuetocué, 2021), which is built with the participation of the elderly, mothers, and teachers, and has seven basic components: mother language, history, community, Spanish, geohistory, natural sciences, and mathematics. They also include areas, such as handcrafts, folklore, ancestral traditional history, and cultural legacy (Mendoza, 2010).

Fig. 1 Reading manual in Palenquero Creole. Pictures taken by Luzkarime Calle-Díaz in Palenque, Colombia.

Language planning, as stated by Kloss (1969), usually has two foci: corpus planning and status planning. Both entail efforts made by speakers to sustain or revitalize their own language and, therefore, identity. The former refers to the creation, modification or revitalization of language forms or codes (vocabulary, spelling, etc.). The latter has to do with the recognition of the social functions of a language and its position in relation to others. This is particularly important in the case of minoritized languages reclaiming spaces facing national governments or mainstream languages. In Latin America, language planning has served as a bottom-up alternative to resist homogenization processes in the face of the pressure exercised by Spanish, Portuguese, and English on Indigenous communities (Hornberger, 1997; McCarthy, 2018).

The Afro-Colombian creole spoken in Palenque, the first town of free slaves in America (Del Castillo, 1984; Dieck, 2008; Friedemann and Patiño Roselli, 1983), is another example of resistance through literacy. In the first two decades of the 21st Century, the community has organized around the formalization of their *Palenquero* and the strengthening of their culture and identity, with the support of foundations and governmental agencies. Literacy development strategies such as the publication of bilingual and monolingual books in their language (Fig. 1), the construction of a community library, and a community center where the elderly share their knowledge with the youth, are contributing to achieve their goal.

The Mikaná ethnic group in the Atlántico department also has used Educación Propia, and the foundations of the Sistema Educativo Indígena Propio (Comisión Nacional de Trabajo y Concertación de Educación para Pueblos Indígenas - CONTCEPI, 2013) to develop their “own indigenous educational model for the Malambo territory”, which aims at revitalizing their language and culture, and articulating it with the national education system, based on the pillars of unity, autonomy, territory, culture, spirituality, and interculturality (Peralta et al., 2019).

In sum, Educación Propia constitutes an alternative to dismantle mainstream education which seeks to impose values that are not part of the native peoples’ identities. Educación Propia aims at strengthening native peoples’ identity and sense of belonging. As Indigenous people say, in this education, we learn our own language, cultural values, traditions, myths, dances, forms of production, in other words, we learn to be Indigenous (Comisión Nacional de Trabajo y Concertación de Educación para Pueblos Indígenas - CONTCEPI, 2013, p. 19).

Intercultural education initiatives

Across Latin America, the concept of interculturality is seen as emerging from the struggles over political and linguistic rights within Indigenous communities (Tinajero and Englander, 2011). In Mexico, intercultural policies and practices have been instituted from the top-down and the bottom-up. By way of example, in 1992, the General Directorate of Indigenous Education (DGEI) produced a document that centered the voices and actions of Indigenous communities in their own education (Tirzo Gómez, 2021). It posited that Indigenous communities have the right to participate in their own development. However, despite national reforms, there have

still been many problems such as: a lack of infrastructure and funding to support the reforms; professionalization of teachers who speak indigenous languages; lack of appropriate pedagogical materials including access to the Internet and digital devices.

Consequently, one of the primary causes of the Zapatista rebellion starting in 1994 was the lack of substantive emphasis of Indigenous languages in the educational system (e.g., Tseltal and Tzotzil) (García and Velasco, 2012). In 1995, Mayan educators from the state of Chiapas created Unión de Maestros de la Nueva Educación para México (UNEM), a union for educators.

Nigh and Bertely (2018) reviewed three related, contemporary intercultural education projects designed in Chiapas by Indigenous educators. Each of these is considered to be an Indigenous led, intercultural inductive method (referred to as MMI, its name in Spanish). The goal of MMI is to formalize Indigenous pedagogies and knowledge. Examples of these projects include Laboratorios Socionaturales Vivos, Milpas Educativas (Living Socio-Natural Laboratories and Educational Milpas) and Laboratorios para la Vida (Laboratories for Life, a school garden project) (Nigh and Bertely, 2018; Sartorello, 2021).

Some of the unifying elements of these projects include the following: establishing relationships between education, cultural activity, and ecological awareness; expanding Indigenous knowledge, values, and meanings with Western scientific knowledge; inviting participants to engage in school gardens and educational milpas; and appreciating that dialogue is not free of conflicts (Nigh and Bertely, 2018, p. 5). In particular, what Gasché (2008) refers to as “cultural syntax” is vital to the efforts of linguistic and cultural preservation of Indigenous knowledge.

The UNEM (Unión de la Nueva Educación de México), formed in 1995 by Mayan educators, evolved into the Network of Intercultural Education, REDIIIN (Red de Educación Inductiva Intercultural), with over three hundred participating educators (Moreno Medrano and Corral Guillé, 2019). The network includes collaborations between Indigenous and non-Indigenous educators and across countries (Mexico and Brazil). This contribution documents some conditions that ensure the permanence of the altermunicipal educational project developed by the Inductive Intercultural Education Network in Mexico and Brazil.

Intercultural bilingual education from within: IBE

The notion of intercultural bilingual education (IBE) has gained importance throughout Latin America in the last decades. It emerged in response to continuous struggles from native communities to reclaim the status of their linguistic and identity diversity in different countries. This notion entails not only the right to create and implement their own educational practices, but also the dialogue between Indigenous communities and hegemonic epistemologies.

In a thorough review of IBE and the intercultural approach in Latin American educational systems, Corbetta et al. (2018) provided an overview of different models that have been put into place in these countries. The connection between interculturality and education became more visible after the acknowledgment of 11 Latin American countries (Argentina, Bolivia, Brazil, Colombia, Ecuador, Guatemala, Mexico, Nicaragua, Paraguay, Peru and Venezuela) of their multiethnic, plurilingual, and multicultural character in their national constitutions between 1990 and 2010. Chile and Panama did so through specific laws and a ministerial policy, respectively. Only four countries also included Afro-descendant communities in their Carta magna (Corbetta et al., 2018).

When analyzing the status of Indigenous and Afro descendant languages with respect to official languages, Corbetta et al. (2018, p. 64) found that countries like Bolivia, Colombia, Ecuador, Nicaragua, Peru, and Venezuela include vernacular languages (e.g., Kichwua, Suar, Guaraní, Quechua, Aimara, and others) as official in their (or parts of their) territories. In the case of Brazil, Indigenous communities are entitled to use their mother languages and their own learning methods. In countries like Mexico and Costa Rica, the state has to ensure the maintenance, preservation, and cultivation of their native languages. Panama and El Salvador declare them objects of study, conservation and/or divulgation. On the other hand, Guatemala, Venezuela, and Paraguay place the languages spoken in their territories as cultural patrimony of their nations.

Ecuador has been one of the referents in Latin America in terms of IBE. The struggle of more than 30 Indigenous peoples and nationalities across the country yielded its fruits with the current National Constitution, issued in 2008, by which the state recognized the intercultural and plurinational character of the nation. Ecuador has a Model of Intercultural Bilingual Education (MOSEIB), as part of the Ministry of Education policies, that currently generates guidelines for 17 nationalities, and 18 Indigenous peoples that co-live in its territories (Bastidas, 2015). Paronyan and Cuenca (2018) highlight some positive impact of the project in terms of attendance, promotion, and decrease of drop-out and repetition. It has also increased communal participation, and the intervention of parents and Indigenous families in the development of educational activities. Other important achievements have to do with teacher education programs in pedagogical institutions, as well as the incorporation of intercultural bilingual education programs in two important universities in the country (Paronyan and Cuenca, 2018). Some of the strategies put forward by IBE in Ecuador have centered around decolonization practices, as underlined by Conejo (2008, p. 75):

- Learning of Indigenous languages, as a process of pedagogical decolonization and interculturalization of children, starting with the Community Family Children's education that begins before their birth.
- The inclusion of bilingual teachers so that communication with students, and learning become fluid. This replaced the homogenic teaching of Spanish that worked against the postulates of interculturality.
- A rupture in the teaching of disciplines to allow for studies in Indigenous languages, history of Indigenous people, Andean literature, life sciences, Indigenous medicine; together with universal knowledge, technology and English as a strategy to access other cultural spaces.
- The transformation of traditional schools into Community Educational Centers (CEC), conceiving learning beyond the classroom, and turning the whole community into a space for learning and reflection, promoting the interculturalization of

learning spaces and methodologies. This includes workshops, agricultural tasks, institutions, meetings, *mingas*, plants, animals, ceremonial sites, rivers and mountains.

- Recognition of the elderly as the “great wise men” who share cultural knowledges. In the IBE view, these men are not considered illiterate, as they would in the Eurocentric, dominant perspective, considering they cannot read or write. On the contrary, they possess great knowledge and experience that can be passed on to their children and grandchildren.

IBE has also been used in Venezuela, as an alternative to resist the colonality of knowledge/power (Mignolo, 2003), and strengthen the identity of the Wayúu communities located in the northern urban context of Maracaibo. By means of learning communities, some efforts have been made to sustain their ancestral knowledge and native language, despite continuous challenges and tensions (Guerra and Finol, 2015).

Bolivia is one of the few countries in Latin America where the majority of the population is Indigenous, with presence both in rural and urban contexts (López, 2006). There are 36 Indigenous groups and 33 Indigenous languages across the country; three of them have been declared official languages: Quechua, Guaraní, and Aymara, due to their significant number of speakers. IBE emerged in 1989, sponsored by the National Ministry of Education and the United Nations International Children's Emergency Fund (UNICEF). It led to an educational reform prepared by the Equipo Técnico de Apoyo a la Reforma Educativa (ETARE) and issued in 1994 (López, 2005). By 2001, after a series of national educational policies that supported intercultural and bilingual education, 115,000 Quechua, Guaraní, and Aymara children had been included in this new curriculum, with a coverage of 2,300 rural schools (Albó and Anaya, 2004). According to Arispe (2008), some important achievements of IBE in Bolivia are: social participation in education, teacher education programs, curriculum management, and social appropriation of their own languages.

In Bolivia, as in other Latin American countries, IBE constitutes an important component in the formation of new mentalities and visions about the relationship State-Indigenous peoples (López, 2005). This has allowed indigenous groups to legitimately interact and interpellate the government beyond Indigenous issues of land and education, and toward the common good of the nation (López and Küper, 1999). Important events in the history of the country, such as La Guerra del Agua in 2000, and La Guerra del Gas in 2003 marked important milestones in the recognition of Indigenous rights and perspectives against neoliberal projects. These contributed to a process of structural transformation, which included the resignification of national educational policies toward the construction of decolonizing and intercultural education (Gómez et al., 2010). In discussing the advances and challenges on IBE in Bolivia, Zavala (2007) writes, “the implementation of IBE is the cornerstone of a new citizenship” (p. 38). The author goes on to describe three strategies that have allowed to rethink IBE in the country: (a) a strategy of revitalization of Bésiro language in Chiquitanía; (b) a strategy for the teaching of Spanish as a second language in the Guaraní zone; and (c) a strategy of social participation in education as part of the action of the Machaqá Amawt'a Foundation in an Aymara zone of the La Paz department. The first one is particularly interesting for the purpose of this paper because it is an initiative of an Indigenous group (Chiquitanos) that constitutes only the 3% of the Indigenous of Tierras Bajas in Bolivia. However, they have acquired important political force in favor of a language that has been in danger in relation to Spanish. This is a clear example of resistance in a scenario where usually only native languages that are spoken by a significant number of people have been considered by national governments.

In Peru, Quechua is the major indigenous language of the country with more than 3 million speakers, and it “has long been associated with social and political marginalization, economic poverty, and low educational achievement” (Zavala, 2019, p. 60). However, “many NGOs and Indigenous organizations have emphasized the importance of Indigenous knowledge and have considered how to incorporate it into the schooling process” (Zavala, 2014, p. 47). In 2003, the government promised IBE across the educational system (although the efforts to implement IBE started in the 1980s), guaranteeing education in a mother tongue and in Spanish as a second language for all the bilingual people (Trapnell and Neira, 2004). However, the implementation of IBE came with several challenges as many Indigenous populations (Quechua speakers and speakers of other Indigenous languages) have been excluded from these programs and forced to Spanish-only education; the IBE program is often limited to primary education and rural areas; and IBE initiatives are still peripheral and depend largely on the good will of local authorities (Trapnell and Neira, 2004).

While some IBE initiatives focus on language survival following traditional educational methodologies and a governmental agenda, in other initiatives, IBE is linked to the recovery of cultural practices, interculturality, and empowerment with a critical view to racism and discrimination (Zavala, 2014). In this process, literacy planning has been used to revive, maintain and spread the use of Quechua among Indigenous and non-indigenous Peruvians as a resource in a multilingual environment (Hornberger, 2012). After years working with Indigenous communities, Hornberger (2012) states that functional Quechua literacy contributes to “marginalized monolingual and bilingual Quechua speaking populations' fuller participation and empowerment in society” (p. 231). Based on the New Literacy Studies perspective, other scholars have recognized the hybrid literacy practices (alphabetic Quechua, vernacular language, and Spanish) of Indigenous and rural people in the Andes. De la Piedra's (2009) ethnographic work provides thick descriptions of hybrid and bilingual literacy practices of a Quechua community in the Peruvian Andes. This study invites us to broaden our understanding of literacy to include the multimodality of rituals, ceremonies, and living in harmony with the environment.

In other Peruvian contexts, literacy practices are used to question political dynamics around language and to claim a space for Quechua literacy as decolonial action. In particular, urban Quechua youth have constructed alternative versions of Quechuaness to question dominant IBE ideologies by carrying linguistic political actions (Zavala, 2019); “the activists' aim is not to ‘preserve’ languages within a dominant discourse of ‘inclusion’ of the neglected population; rather, they hope to make powerful claims of

belonging and exert new power relationships" (Zavala, 2019, p. 78). "Furthermore, students engage in literacy practices within an increasing elasticity of the concept of language. They deconstruct the association between language, community, identity and culture; they develop translingual practices; use language to change the world; draw on repertoires of social semiotic resources in contemporary contexts; and challenge some of the dichotomies of modernist linguistics (such as language and society; structure and use; native and non-native, etc.)" (Zavala, 2018, n.p.). These initiatives present an elaborated understanding of IBE as a complex concept that can be used for very different purposes.

Brazilian indigenous communities have been deprived of the most basic needs of successive exploitation since colonial rights. Still, resistance occurs in educational approaches (Monzilar, 2020) such as the case of the Kashinawa production of multimodal texts (Menezes de Souza, 2003), which create new relationships between speech, writing, and thought. As stated by Menezes de Souza (2003), the Kashinawa's texts come from complex synaesthetic attempts of transpositions of the wealthy and complexity of Indigenous orality to paper, as "voices on paper." The Kashinawa literacy practices perhaps represent a more or less permanent hybrid form of non-alphabetic writing.

Intercultural teacher education in Alto Xingu resists coloniality of language through challenging colonial values represented by the use of Portuguese in Indigenous schools. It is the case of Kamaiura-Aweti (Kamaiura, 2012) schooling, where classroom events are intertwined with community events. Indigenous teacher education programs, in normal schools, reflect literacy events and practices that are intertwined with conflicted acceptance of Portuguese as a *Lingua Franca* (Kamaiura, 2018). Multimodality allows for approaches to language teaching that considers drawing and storytelling as strategic to creating spaces for sharing traditions and making meaning of colonial experiences.

As we have seen in this section, IBE takes different forms and follows diverse purposes depending on the level of participation of the community and the use of decolonial practices. Although it does not come free of challenges, IBE initiatives offer opportunities to work against the dynamics of the coloniality of language and power.

Urban youth literacies: contemporary forms of resistance in Latin America

Resistance takes many forms in contemporary literacies in Latin America. Social movements continue promoting culturally sustaining approaches to education. Indigenous communities claim ownership of their epistemologies. Through movements that involve rap music, graffiti, blogging, and social media activism, Latin American urban youth represent social practices where literacies enhance the visibility of oppression against peripheral women and men.

Many times, Latin-American youth have been portrayed as deviant or in terms of deficiencies and absence of cultural capital, reading, and writing habits (Trigos-Carrillo, 2019). Bartlett et al. (2011) point that beyond school-based expressions of literacy have grown as an effect of globalization and technology. However, these new forms of literacy allow for social participation in ways that school-based literacy practices tend to delegitimize. Concerning youth literacies, schools still neglect the dehumanizing social and racial conditions experienced by the urban youth in Latin America, and the transformations demanded in forms other than colonial practices.

Latin American rappers, bloggers, social activists, and diverse youth collectives, movements, and leaders engage literacy practices that run counter-hegemonic approaches to education. Resistance is enacted through overlapping literacy practices that reflect contradictions and possibilities of creating new ways of knowing and doing. In Brazil, contemporary literacy research focusing on youth activism, social justice and structural racism, coins terms like *survival literacies* (letramentos de sobrevivência; Maia, 2018), literacies of re-existence (letramentos de reexistência; Souza, 2011) highlight the counter-hegemonic power of literacy practices in transgressive peripheral literacies.

Considering the myriad of metaphorical meanings for different literacy approaches, Windle et al. (2020) offer literacy scholars a pathway for breaking with established paradigms that divorce knowledge production about inequality from subjects and territories. The *transperipheral paradigm* (Windle et al., 2020) aims at connecting regional, national, and global peripheries in the production of knowledge that combines knowledge about, from, and between peripheral communities. Transperipheral literacies and projections offer a paradigm for literacy research that makes meaning of existence, resistances, and languaging in peripheral spaces, intertwined with experiences of exclusion in contemporary forms of oppression.

Hankin (2017), for example, discusses how Cuban hip hop represents a "marginocentric" and transnational flow of cultural capital and the decolonization of knowledge. Cuban hip hop represents an example of how 21st Century literacies in Latin America can be examples of resistance to unequal power relations expressed through the engagement with local experiences of racism, exclusion and re-existence(s) (Souza, 2011). See, for example, the Cuban hip hop group *Orishas* (2006, 2014). Latin American non-school literacy practices widen limited perspectives of literacy that do not consider literacies from below, where social, gender, racial, class, and territorial experiences create spaces for dissent and resistance.

Music, as contemporary literacy practice, has also constituted a tool of resistance for Afro descendants in Colombia. The Rap Folkórico Palenkero by *Kombilesa* (2017, 2020), a group of rappers from Palenque, is an example of using popular art to unveil issues of racism and discrimination in their own creole language. *Chocquibtown* (2010) is a very popular hip hop band from Chocó, the main Afro Colombian (and one of the poorest) region in the country, whose lyrics and artistic representations are used for reclaiming the recognition of their African heritage, their identity, and the key role of Afro descendants in the history of the country. They also raise awareness on systemic racism that still exists across Colombia.

In Brazilian urban contexts, literacy practices use non-school spaces to include the performance of the social identities of Black youth. Black youth experiences Brazil from historically neglected and violent spaces, and resistance takes the form of political and cultural activism in literacy practices. Since the writing of samba lyrics (Vianna and Chasteen, 2000) to contemporary rap music, youth has used art as forms of resistance (e.g., Sabotage, 2013). Present transnational experiences have strengthened the hip-hop culture in Brazilian peripheries. Souza (2011) observes that Black youth in the peripheries of São Paulo captures the social and historical complexity of languaging, and destabilize fossilized power relations through the combination of non-hierarchical multiliteracy practices in the hip-hop movement. Fanzines, rap lyrics, graffiti, and other hip-hop elements transcend schooled views of language and text. The result is that Black youth resists through performing their (re)existence in situated literacy practices.

Critical literacies movement became more robust in the past decade in Brazil. Applied linguists problematize the coloniality of teaching and learning languages in Brazilian contexts, in a movement that reflects some aspects of national guidelines for foreign language education. However, the threat to freedom of speech in schools, represented by claims such as “schools without party/escola sem partido” aim at denying the Freirean view of education as a political act. Critical literacies as an approach to language education are currently under the threat of a conservative, retrograde government that views education as mere knowledge transmission.

Continuing tensions

Despite the great cultural diversity and the significant achievements of regional movements against systemic racism and discrimination (Arocena and Sobottka, 2017), Indigenous and African descendant people in Latin America continue to experience the consequences of colonialism in the 21st Century, such as land displacement and violence (Reding, 2007).

Endogenous and hybrid literacies become central to resisting the coloniality of language, and of power. However, a myriad of tensions continues to exist in the search for more visibility and sustainability of own cultures, languages, and identities. To begin with, intercultural bilingual education (IBE) has several definitions according to the way people approach it. Governmental views of IBE seem to entail a one-way process, where Indigenous communities are required to dialogue with mainstream cultures, but not the other way around (Paronyan and Cuenca, 2018). For instance, in Peru, despite the efforts to revitalize the Quechua language, IBE discourse presents a “depoliticized, limiting and fictitious view of Quechua and Quechuaness” (Zavala, 2019, p. 60). In this sense, García and Velasco (2012) conclude, “as long as bilingual education in Indigenous languages/Spanish is considered only an Indigenous thing, and not a Mexican thing, it will not accomplish much ... Right now, non-Indigenous Mexicans remain largely apathetic toward the Indigenous presence, and bilingual education is entirely one-sided. Racism and linguisticism continue to play a part in the contemptuous attitude toward Indigenous peoples and their languages. This has been a long-standing problem in Latin America” (p. 15).

In addition, there are tensions between neoliberal/governmental functional views and critical perspectives of intercultural education (Ferrão Candau, 2010). While some Latin American governments have included intercultural education programs and initiatives, most of the time these programs are not intended to question the current socio-political model or power structures and are guided by neoliberal policies. However, to dismantle the coloniality of power, a critical perspective of intercultural education is needed, where historical inequities, unjust power relationships, and patterns of domination are questioned and transformed (Ferrão Candau, 2010). Further, intercultural education should not be only for an ethnic or linguistic group, it should be education for all so that we all understand the historical roots of racism and the importance of cultural difference in Latin American societies.

On a similar note, Indigenous communities continue to live under the fear of discrimination and oppression. When joining mainstream educational settings, using their language or any other cultural representations can be regarded as inferior. Some attitudes toward learning that are inherent to their culture: the value of observation, experience, respect for the elderly, importance of oral transmission and cooperation, might be interpreted differently from hegemonic views, where competition, memorization, verbalization, and discipline are the norm. This creates stereotypes that label Indigenous individuals as slow, timid, with scarce vocabulary, or passive in their learning process (Corbetta et al., 2018).

Additionally, language visibilization and revitalization has mainly worked bottom-up. Latin American governments and states have begun to acknowledge their rights only after long, often painful, struggles from native groups. However, it is not enough to promote language survival and Indigenous literacy if it is framed in what Zavala (2018) labels as “essentializing and ancestralizing ideologies of language and identity” (n.p.) that go hand in hand with the coloniality of language and modernist views of education.

On the other hand, tensions related to epistemic diversity arise when Indigenous and Afro descendant communities start to dialogue with hegemonic views. Notions such as research, academia, “higher” education are all influenced by western visions of knowledge, learning, and literacies. This has an impact on who dialogues with whom and by which means, therefore contributing to unbalanced flows of knowledge. This was clearly visible when conducting research for this paper. Finding literature about Indigenous literacies written by Indigenous people is scarce in Latin America. Science and research are still perceived from a Eurocentric, dominant perspective (Mignolo, 2013), which often translates into academic literacies (and superiority) being measured by, for instance, the number of written publications (Hanauer et al., 2019). This leaves aside the richness of other literacies that carry more value for Indigenous and Afro descendant peoples (Useda Sánchez, 2020). More openness is needed in terms of the hierarchies of literacies, and the superiority of written over oral languages. We argue for the inclusion of more opportunities for epistemologies of the South (Santos, 2015) to come to the front and have spaces of amplification.

Visions for the future

Literacy in Latin America has long been affected by the colonial experiences that shaped both tensions and resistance. In our visions for the future, literacy practices will come from diverse backgrounds, movements and technology innovations that will embrace decolonial perspectives. By incorporating multiple perspectives, needs and possibilities, literacy scholars and educators will continue engaging in decolonizing imbalanced power relations that lead to the dominance of certain forms of literacy over others. Literacy educators and scholars will develop fluid conceptions of literacies that include pathways to multimodal and hybrid learning and representation. We envision fluidity including academic literacies that affect the dissemination of knowledge and epistemologies. Transnational, transperipheral and multiple pathways to global and local connection mediated by digital technologies. Digital networks connecting learners, educators, scholars across historically contested or divided spaces will continue emerging as catalysts for literacies as resistance and disruption.

Literacies need to serve rather than threaten epistemological diversity and cognitive justice (alternative ways of understanding research, and educational processes, more visibility to Indigenous research in mainstream publications). Leaving coloniality behind requires creating spaces for understanding and disrupting the legacies of a violent and oppressive past that appropriated of Indigenous lands, Black bodies and erased multiple epistemologies, languages and cultures. The reclaiming of endogenous family and community knowledges as the basis of educational literacies and human development will lead to more ethical approaches to literacy education and research.

Finally, we understand that the scholarship of literacy will develop historical consciousness through resistant, transnational and critical literacy practices. As political acts, literacy educators and researchers will move literacies beyond the persistent oppression from colonial pasts.

Acknowledgment

We would like to acknowledge the support of Karen Colmenares, Colombian undergraduate research assistant.

Introduction

Literacy is informed by linguistic and social processes. While literacy and its acquisition are reflecting its corresponding language characteristics, they are undoubtedly also socially-based capacities and activities, particularly in their embodied social values and sociocultural environ including political and ideological tendencies (Santana, 2000; Venezky, 1996). The current chapter will give an overview of Chinese literacy in this broad sense, highlighting not only the linguistic features that underlie literacy and its acquisition in China, but also some related social forces and language practices that have impacted literacy conditions. Specifically, the chapter is divided into three sections: A description of language and writing systems in China, a summative highlight of literacy acquisition features and reformative and research efforts, and a short conclusion to offer some directions for further research that can have implications for literacy acquisitions and literacy policy. To make it accessible to the western readers accustomed to literacy in alphabetic language context, the current chapter will provide, whenever possible, a comparative frame of reference to English when discussing the literacy situation in China.

Language and writing system in China: a quick survey

Different writing systems capture their respective languages differently (Hooker, 1990). Orthographies of different writing systems are usually categorized by their different degrees of phonological transparency in their graphs to languages (Katz and Frost, 1992). In this sense, Chinese can be characterized as a deep orthography with tenuous signaling of its spoken language in its graphs. In addition, the Chinese writing system has two extra layers of complexity in its relationship with spoken language: its enduring role as the script for multiple regional dialects across China, and that the predominant form of writing used to be a highly literate form called Wenyan Wen with little connection to oral language (Norman, 1987). Both features further complicate the relationship between the written language and spoken language. In this subsection, we will briefly describe the spoken language situation, the characteristics of the writing system, the practices of literacy acquisition in the context of its writing system and the language situation.

Oral language in China: dialects and cross-dialect communications

Chinese oral language, like any native tongue in the world, is the language spoken by the Chinese people. But its relationship with literacy is more complicated than that in any alphabetic language writing system, which is mainly due to the fact that the relationship is mediated by the multiple dialects in China that are not mutually intelligible, and by the one writing system. Briefly speaking, aside from languages of national minorities, the main Chinese language is the one spoken by the Han nationals. Among the Han Chinese, there are seven major dialects: Mandarin, Min, Hakka, Yue, Wu, Gan, and Xiang dialects (Chen, 1999). A majority of more than 70% of Chinese speak a variant of Mandarin in the areas mostly north of the Yangtze River, whereas the other six dialects are mainly concentrated in the southern and southeast regions of China. Even though all the dialects share fundamentally similar grammar and semantic features, they do have drastically different pronunciations that make their users distinct. Without training or extended exposure to other dialects, a dialect user will be limited in his/her ability to communicate across dialect zones. For alphabetic language users, such oral language situation may be difficult to conceive, particularly when it comes to communications across dialect regions. For Chinese people, this is a common and practical issue and there are usually three ways to overcome the dialectal barrier between two dialect regions. Firstly, people can either receive focused training or pick up the dialect through

extensive exposure, as observed of emerging prominence of Cantonese (Yue dialect) words by Ichikawa and Komatsu (2008, pp. 184–188). Frequent exposures, both purposeful and unintentional, made the economically advanced Guangdong's Yue dialect more popular and familiar among other dialect users. Secondly, a common language for communication has always been in existence to bridge the communication barrier across dialect regions. It has always been the dialect spoken around the capital of the time (Wilkinson, 1998). The modern day common language—Putonghua, a mandarin dialect variant around Beijing region—started its development a little over a hundred years old, making it the latest effort to counter the adverse effect of dialects for communications over the vast territory of China.

Thirdly, people can communicate through written language. Literate people from different dialect regions can communicate with each other if they are unable to do so orally. Chinese script is unified and understood to anyone who can perform functional literacy to their own abilities such as reading and writing a letter regardless of different dialects. Thus, traveling to other dialect regions will not pose communication difficulties for people when they can rely on writing (Chu, 1973; Schirokauer, 1989). Occasionally, on-the-spot “pen talk” is also resorted to when oral communication is not successful (Chang and Chang, 1978), highlighting the communicative utility of the Chinese writing script as a saving feature for the diverse dialect situation.

In short, dialects have been in existence in China since antiquity, the communication obstacle has been a common daily phenomenon, making it both a problem and opportunity for literacy applications and reforms in China. The key to understand this lies in the fact that among all these mutually unintelligible dialects there is only one writing system, which we will discuss in some detail below.

Chinese writing system: character tones, formation principles of characters, and challenges

Scholars in linguistic and historical linguistics have studied the Chinese written language, and come up with definitions with degrees of difference in technicalities (See Qiu, 2009), but have consented to the general conclusion that it is a writing system different from an alphabetic system such as English (See Hansen, 1983). The present section is to highlight only these properties of the Chinese writing system that are relevant to literacy education and acquisition (See Tao and Qian, 2012a, pp. 2–7). All references to the phonological aspects of Chinese written language are made to the modern common language—Putonghua. And discussions of its orthographic nature are likewise about the modern Chinese unless otherwise indicated.

The Chinese writing system is a non-alphabetic system (Xu, 2009). Generally speaking, Chinese orthography can be considered ideographic in essence, consisting of mono-syllabic and tonal units called characters. Characters can be further categorized into simple characters and compound characters. Simple characters are stand-alone ones that have their own meanings such as mountain (山), water (水), person (人), or numbers (甲, 乙). They are few in number but very essential since they are still the most frequently used characters, helping as well constitute compound characters (Wilkinson, 1998). The compound characters are the majority (Zhou, Y. 2004), made up of two or more radicals and other components, some of which are still used as stand-alone simple characters. When written, all characters, simple or compound, take up an equal space, making them visually distinct individual units.

Since Chinese characters are non-alphabetic but fundamentally ideographic units, they are always pronounced as a single syllable entity (Zhou, Z. 2004). Phonemes as separate individual sub-units are never saliently pronounced by themselves in isolation, nor are they useful in offering help to readers and writers to identify and produce regular consistency at the phoneme level (Siok and Fletcher, 2001). For example, 人 (pronounced as/ren/) and 日 (pronounced as/ri/) are two simple characters. The pair shares the same beginning phoneme/r/. Yet, their physical forms contain no clues to that phoneme. Another pair of characters 人 (/ren/) and 从 (pronounced as/cong/) shares some semblance in their orthographic form. Yet, nothing at the phoneme level cues any phonetic connection between the two. In other words, knowing the characters and being aware of the constituting phonemes are not correlated with graphemes in the Chinese writing system. Therefore, while phonemic awareness is a very important insight and pre-requisite for learning English, it does not appear to be true in Chinese (see Holm and Dodd, 1996; Shu et al., 2006).

Modern Chinese as a tonal language has four tones at syllable level: level tone, rising tone, falling-rising tone, and falling tone (Chen, 1999). Each character has a tone attached to it. A number of characters would take two or more different tones often when they are used as homographs (see Table 1), which may also assume different pronunciations. But the majority of characters are of one tone only. This syllable level tonal occurrence is often difficult for non-native speakers to comprehend and acquire mainly due to the lack of tone specificity at the syllable level in languages such as English. But in Chinese tones are fixed to each character or syllable, making it mandatory to use the tones at syllable/character level for differentiation among characters of similar syllable pronunciations. It is part of phonological information for characters. However, characters themselves do not have tonal indicators when written, even the partially useful phonetic radicals are of little help here (Zhou, Y. 2004), making the tones of limited use in helping with character recognition. But as part of the phonological feature of every Chinese character, tones are explored by research as a type of implicit knowledge of the language that connects the oral with the script, and have been found to play a subtle role in phonological memory of characters (see Shu et al., 2008; Xu, 1991; Yip, 2014; Zhang and McBride-Chang, 2010).

Character formations are at the core of Chinese script (Qiu, 2009). According to traditional understanding and practices, there are six principles that reflect Chinese character construction (Xu, 121/1989), first clearly explained by Xu Shen as follows: pictographic characters (象形), simple ideographic characters (指事), compound ideographic characters (会意), semantic-phonetic characters (形声), loan characters (假借), and inter-explaining characters (转注). Except for the last two, the other four are structurally-based analyses of character construction (Su, 1997). Understanding how characters are formed is believed to be

Table 1 Samples of homographs with different tones and homographs of different pronunciations.

<i>Homographs with same pronunciations but different tones</i>		
<i>Chinese character</i>	<i>Pronunciation and tone (meaning)</i>	<i>Pronunciation and tone (meaning)</i>
好	hao3* (good, nice)	hao4 (like)
创	chuang1 (injury)	chuang4 (create)
漂	piao1 (float)	piao4 (beautiful)
Homographs with different pronunciations and different or same tones		
强	qiang2 (strong)	jiang4 (stubborn)
行	xing2 (move)	hang2 (line)
恶	e4 (evil)	wu4 (loathe)

NOTE: The asterisk (*) denotes that the pronunciation in pinyin is followed by a number that indicates one of the four tones in Mandarin Chinese.

helpful for Chinese learners (Zhang et al., 2000), even though knowledge of various structural information was found to be of different values at different stages of learning Chinese (Ho et al., 2003). Pictographic characters imitate the shape and look of the objects they used in ancient time and, no matter what script styles they evolve into, they still retain the abstract strokes of original characters, mostly providing learners with some lexical aid to access the meanings of the characters. Examples would be 日 (sun) and 月 (moon). These characters are not abundant but are usually among the first characters to be learned. They also serve today a very active role as radicals, often times in slightly altered variants, in a compound character in the last category of semantic-phonetic characters (Zhou, Y. 2004), making them very useful characters for beginning learners (Zhang et al., 2000).

Simple ideographic characters are also limited in number and symbolize concepts through their stroke structures or positions. For example, the characters 上 (up or above) and 下 (down or below) have a long bar with either a pointing post above or below the bar to signify the meanings. Such lexical suggestions, though, are more mnemonic than explicit meaning indicators, providing usually a memory support for beginning learners to access the characters. The next category of compound ideographic characters has an indirect indicative element but the meaningful radicals in them would combine to give a more complex and abstract meaning than simple ideographic characters can. For example, the characters 信 (trust) is expressing concepts that are born out of the fundamental radicals in them. The character “trust” is formed by a “person” radical and a “say” radical, signaling that “trust” should be something promised by someone in words (Qiu, 2009). This type of characters, acting very much like the previous two categories of pictographic and simple ideographic characters, is fundamentally symbolic and semantic in nature. But unlike the previous two, this type of characters is of dubious help for beginning learners. It should be noted that the commonly used characters of all these three categories culled together are no more than 500 in today’s writing. Most characters in current use belong to the next category: semantic-phonetic characters (Chen, 1999).

Semantic-phonetic characters refer to characters that have both semantic and phonetic radicals. Semantic radicals provide suggestions about meanings but in a broad manner, usually indicating a categorical property of the characters in question. Phonetic radicals likewise also provide some possible approximations but not with precision. Radicals, even with their broad suggestiveness, are still found to support learning to read in Chinese (Tong et al., 2017). To understand their functions, let us look at two pairs of examples: 铜 (copper, pronounced as/tong/) and 钢 (steel, pronounced as/gang/); 漂 (float, pronounced as/piao/) and 湖 (lake, pronounced as/hu/). The “metal” (钅) radical in the first two characters indicates semantically these two characters may belong to metals. The second pair of characters shares a “water” (氵) radical showing that the characters are water-related in meaning. These examples have provided a quick glimpse into how semantic radicals work to broadly hint at the property of their referenced things or concepts, offering a relative efficient semantic access for users via orthography without phonological mediation (Zhang et al., 2014). Phonetically for the all these sample characters here, they happen to have pronounced the same as their phonetic radicals standing alone in modern Chinese.

However, phonetic radicals, though useful in the earlier stages of learning characters (Tong et al., 2017), can be very ambiguous and are found to have an accuracy rate of only 39% for the pronunciations in modern Chinese characters (Zhou, Y. 2004), much lower than the estimated lexical suggestions of about 80% by semantic radicals (Tan and Perfetti, 1998), and not comparable to the phonological information in any spelled syllable in English (e.g., Ehri, 2014). Yet, since this type of semantic-phonetic characters makes up the majority of Chinese characters, these radical features do have effects on learners’ character recognition skills: learners are found to have developed an awareness of the positioning of common radicals in characters, and becoming more aware of possible suggestive phonological values of phonetic radicals and broad semantic categories (Tong et al., 2017), making awareness of the functions of radicals particularly important in learning Chinese (Ho et al., 2003).

Such phonetic ambiguity in characters indicates the complex relation between Chinese oral language and its writing system, presenting special challenges in learning Chinese script. Historically, Chinese writing is said to have been moving in the direction of characters having more and more phonetic indicative powers in the use of phonetic radicals (Zhou, Z. 2004), moving from “read-like” whole character approach in ancient Han time (206 BC–CE 220) to Fan Qie (onset-rime approximation) in Wei-Jin times (CE 220–280) (see Zhou, Z. 2004), to various Romanization efforts in modern time (Ichikawa and Komatsu, 2008). For Chinese, efforts to increase phonological transparency are expressed mainly by adding phonetic radicals to existing characters (Zhou, Z. 2004). In

other words, newly-minted characters tend to increase phonological information. But even such attempts using embedded phonological approximation over times come at a cognitive cost for learners. Since Chinese characters are stand-alone orthographic and syllabic units, any added phonetic radicals will increase the complexity within characters, making such phonetically enhanced characters more complex and consequently difficult to learn. We will return to this in the next paragraph. For now, we want to point out that the practice of adding phonological information has been a welcome effort in facilitating character recognition (Ho et al., 2003), and has seemed to have been adopted in modern China's elementary textbooks (Shu et al., 2003). But at the same time, thanks to the inconsistency of the practice as reflected in existing characters, such phonetic radicals, carrying different phonological information of different times due to oral language changes and other deviations, makes it not that transparent as its phonetic radicals would promise (Zhou, 2009), making phonological access through these phonetic radicals always an analogical approximation.

A related challenge in pursuing phonetic transparency through added radicals, both phonetic and semantic, is the increased orthographic complexity, an undesirable phenomenon for any script but particularly troubling for Chinese. Chinese characters act visually like English words, written with spaces to signal a separate character. However, for English, a word's visual complexity is usually expressed by the number of letters and syllables in it (Fry, 1989). The physical space a word occupies therefore varies, depending on the number of letters, and reflects that complexity. In contrast, Chinese characters use strokes, radicals in their formation, and always take up a similar square space visually. Its visual complexity is dependent on the number of strokes and radicals. For example, characters 日 (meaning "sun," with 4 strokes) and 曙 (meaning "dawn," with 17 strokes or two radicals) takes up an equal space in writing. The complexity is within a given space of any characters rather than without. This implies that strokes and radicals will change their sizes to fit into their positions in a character, a different approach than English in handling its visual complexity. Researchers have found that this complexity within a character must have had a reverse effect on learners' lexical processing in reading (Qian et al., 1994), and was certainly affecting the rate of writing as argued by Youguan Zhou (2004). Therefore, such a practice of moving toward phonetic transparency by adding radicals to create new characters is likely to add to the complexity and difficulty of characters, particularly challenging for beginners who are learning to pay more attention to the radicals within characters (Ho et al., 2003; Tong et al., 2017).

This, of course, has created more characters for the corpus of Chinese language, a phenomenon partially attested to by the steadily expanding dictionaries over times (Chen, 1999; Wilkinson, 1998). A quick and brief listing of the characters available in four major milestone dictionaries in China would give us some sense about the increase of characters over times. First Chinese dictionary *Shuo Wen Jie Zi* at about CE 100 contains 9,353 characters (Su, 1997). *Lei Pian* (Dictionary of Characters Categorized) compiled in 1066, following *Shuo Wen Jie Zi*'s format, has 31,319 characters in it (Liu, 2004). *Kang Xi Zi Dian* (Dictionary Compiled in the Kang Xi Period) of 1716, as one of the most consulted dictionaries for the past two hundred some years, lists 47,035 characters (Liu, 2004). The modern Chinese comprehensive dictionary *Han Yu Dai Zi Dian* published in 1990 includes 54,678 characters (Yin and Wang, 2008). The incremental accumulation of Chinese characters over time shows a clear upward trajectory, making any attempt to acquire the available characters a tremendous and literally impossible cognitive challenge.

Answers to the challenges embedded in Chinese orthography

In this section, we are focusing on the efforts to approach the afore-mentioned challenges to script acquisition posed by Chinese orthography, namely, the Pinyin adoption to make Chinese characters phonetically accessible, character simplification to reduce the orthographic complexity of some characters, and a constant number of characters in use to avoid the large number of existing characters for acquisition.

Pinyin, the latest in the series of Romanization of the Chinese writing system, is an officially endorsed system developed to index Chinese characters in roman alphabets. Unlike its ancient predecessors of "read-like" and Fan Qie, Pinyin moves in the direction of Romanization, literally meaning "spell the sound." It is premised on a common language, or the standard pronunciations (Zhou, Y. 2004), and, in turn, promotes the school use of Putonghua. The Pinyin system uses 25 Roman alphabetic letters without the letter "v" to represent 56 initials and finals (see Table 2) in characters according to the common language—Putonghua, the Mandarin dialect. As a sound indexing system, Pinyin provides a direct access to the phonological information of characters in Putonghua pronunciations. For example, "dou" and "liao" are directly spelling the sounds of two Chinese characters: 斗 and 料. Pinyin use, therefore, could alleviate the burden of remembering the unexpressed phonetic values of these two Chinese characters, reducing the phonetic ambiguity of Chinese characters. It is for this reason that the Pinyin system is now used in almost all beginning literacy learning texts and dictionaries in Mainland China (Zhang et al., 2000). All learners will move from Pinyin to characters in a rapid fashion (Si, 1982), a practice that has been found to have a sustained early start on reading and writing (Liu, 2005). But Pinyin in its current application does become an effective assistive means to help connect the standard oral language—Putonghua—with Chinese script for beginning learners (Lin et al., 2010). In this assistive spirit, even moderately extended period of using Pinyin in upper primary schools was found to have an encouraging effect when used together with characters (Liu, 2005). Yet, this solution to the challenge of phonetic ambiguity in the characters is not perfect mainly due to the homophonic phenomenon in Chinese script, which stands at an average estimate of somewhere between 6 and 40 homophones for each existing syllable in modern Chinese. The ambiguity would not be resolved without incurring the assistance of actual characters (Zhou, Y. 2004), a tendency literally having helped retain some orthographic complexity of characters as well as convincing the users and policy-makers alike that Pinyin would remain as a sound-indexing system rather than the written language.

Table 2 Twenty-five letters^a in Pinyin for 21 initials and 35 finals in Chinese^b.

25 letters							
a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, w, x, y, z							
21 initials							
b	p	m	f	d	t	n	l
g	k	h		j	q	x	
zh	ch	sh	r	z	c	s	
35 finals							
	i	u	ü				
a	ia	ua					
o		uo					
e	ie		üe				
ai		uai					
ei		uei					
ao	iao						
ou	iou						
an	ian	uan	üan				
en	in	uen	ün				
ang	iang	uang					
eng	ing	ueng					
ong	iong						

^aThe letter v is not present in the Pinyin system. In addition, a two-dot diacritic-added “ü” is an additional vowel which will change to the letter “u” when preceded by initials “j,” “q,” “x” and “y.”

^bThese 56 initials and finals cover all initial sounds and final sounds in Chinese characters but some rule-based changes will occur in actual onsets and rimes. Such rule-based changes would call in semi-vowels “y” and “w” as onsets for some medials and finals in specified contexts, and would also yield several rimes not listed in the finals in specified contexts. Refer for the specifics to [Institute of Linguistics CASS \(1979\)](#), pp. 1565–1567.

Modified from source [Institute of Linguistics CASS \(1979\)](#), pp. 1565–1567).

The orthographic complexity of characters has always been the challenge for learners and users. As pointed out, the complexity comes from its character formation approaches that continuously call for compounding characters through additional phonetic and semantic radicals. Such within-character complexity, while adding some phonetic consistency and semantic directions to characters, exacts a cognitive demand on the learners, forcing them to slow down to encode the complexity for character recognition. To counter such a challenge of increasing character complexity, Chinese script has traditionally adopted scriptural simplifications: script style changes and character simplifications. Script style changes occurred over long periods of time and were usually gradual, moving from archaic script styles with pictographic resemblance to ideographic abstraction, particularly expressed with streamlined radicals and straight and un-curved strokes ([Qiu, 2009](#)). The modern-looking clerical script style first emerged in popular use more than two thousand years ago ([Yin and Wang, 2008](#)). Script style changes (see [Table 3](#)) usually facilitate writing and should also enhance character recognition for readers. Character simplifications efforts meanwhile were seen throughout the history, including the most recent ones in the Mainland China that occurred in 1956 and 1964 simplifying 2236 frequently used characters all told by reducing their average number of strokes from 10.98 to 8.94, about a 20% reduction ([Zhou, Y. 2004](#)), a significant drop in the

Table 3 Chinese character script changes over history.

Character definitions	Oracle bone script samples (late Shang, West Zhou)	Small seal script samples (Warring States, West Han)	Clerical script samples [4th century BC(Qin)—4th c. CE]	Traditional script samples (modern time)	Simplified script samples (modern time)

complexity inside these characters. They were received by the society and many are still continued in current usage. However, the solution efforts to reduce the complexity of characters through simplification have also made it abundantly clear that simplification is not always a result of top-down decision, be they scholarly or administrative. They are usually based both on practice and on the script's internal features. For example, from a practice-based perspective, a second attempt of character simplification eventually failed after 1981 because that batch of 853 characters were too esoteric and not in circulation already (Qiu, 2009; Zhou, Y. 2004), indicating the power of popular use in the writing system development. Youguan Zhou (2004) has also pointed out that the internal features such as the informational load expressed by character complexity would play a role in eventual popular acceptance or rejection of a character, because an oversimplified character would lose its original information in the eyes of mature users (pp. 357–360). It is also likely that in the computer age, character complexity would be less burdensome in character recognition and production than before when computer input of Pinyin alone or coupled with character features allows for enhanced early ability of character recognition and writing (Liu and Zhang, 2006).

As to the issue of the ever-increasing number of characters, scholars have noted that the Chinese language itself has developed a practical response to it: rotating out the dated and obsolete characters, and retaining and using only a constant range of characters (Zhou, Z. 2004). In modern China, for example, estimates about characters in use from common entries in ordinary dictionaries, print-needed characters, and character frequency studies point to about a range of 5,000 to 6,000 common characters in addition to some extra characters that are rare, discipline-specific and seldom used. The addition of the latter might top out the modern character numbers at 9,000 at most (Zhang et al., 2000). For example, in a large-scale selection of frequently used characters sponsored by China's National Language Working Committee, researchers extracted the 2,500 highest frequency characters and the next 1,000 highest frequency characters, from a list of 15 publications of frequently used characters over a period of 58 years, and from the five other sources of commonly used characters, and then subjected these 3,500 characters to a two million character sample from three popular sources of newspapers, popular science magazines, and literature magazines. The most frequently used 2,500 characters have been found to have covered 97.97% of all characters used and the additional 1,000 have increased the coverage to 99.48% of all characters in the whole sample (see Appendix V in Yin and Wang, 2008, pp. 301–316), demonstrating the utility of these three thousand five hundred characters for being literately functional in the modern society. Students in Chinese schools are required to reach the similar range of numbers of characters for literacy levels: recognizing 3,000 characters at the end of elementary school and no fewer than 3,500 characters for finishing the whole nine years of compulsory education (Zhang et al., 2000). Knowledge of five to six thousand characters would qualify for advanced literacy in modern China (Wilkinson, 1998). There are some indications that historically the required characters have never been exorbitantly higher than the current range of number of characters (Wilkinson, 1998; Yin and Wang, 2008; Zhou, Y. 2004).

The dichotomy of increasingly more characters in dictionaries and a constant range of characters in use is showing a very interesting picture, particularly if Chinese character growth is claimed as going hand in hand with new concepts and expressions in the society (Huang and Meng, 2001). There is a fundamental reason for the number of characters to be kept within an adequate range. It comes primarily from the power of word formation by characters. To understand this, we need to understand the relationship between characters and words in Chinese. Linguists regard characters as morphemes, not words, because most of the meaningful expressions in modern Chinese are of multi-character (Wilkinson, 1998), thus making characters behave linguistically more like morphemes than words. In such multi-character words, characters serve as a meaningful component or a morpheme (Chen, 1999; Packard, 2015). For example, the expression “today” in Chinese is 今天 that contains two meaningful characters: “now” and “day.” They are seldom used alone as two stand-alone words now as they usually did in archaic Chinese (Qi, 1997). Instead, they usually combine with other characters to form related words such as 今晨 (this morning), 今昔 (now and then), 天桥 (overpass), or 天气 (weather). Therefore, in their forming the modern words, they behave more like compound words in English with free morphemes. Moreover, treating characters as morphemes overlooks the internal complexity we have shown when discussing the compound characters that carry semantic radicals. Take the compound characters 晨 and 桥 or simple characters 今 and 气 for examples. The first two contain radicals that can stand alone as simple characters such as 日 (sun), 辰 (celestial bodies), 木 (wood), 乔 (tall), and the last two can be combined into compound characters, with additional radicals, such as 矜 (pity) and 氡 (radon). These examples do not merely show the inadequacy of simply using an alphabet-based linguistic concept in Chinese without modifications, they also at the same time highlight why characters are so powerful in forming new words (Wilkinson, 1998). For example, all 626 newly coined expressions in 2010 in fact consist only of existing characters (see Hou and Zhou, 2011). Therefore, the power of characters to form words and expressions is tremendous, contributing to the constant range of characters required over times, and thereby, together with rotating out the obsolete characters and rotating in or creating new characters, providing a solution to the cognitive challenge of the increasing number of characters.

Writings and language beyond orthography: Wenyan Wen and Baihua Wen

We would be amiss if we focus only on the Chinese script and its features and relationship to oral language. Writing as an intellectual and social practice play a very important role too in how oral language is functionally captured in words. We will briefly talk about an archaic but enduring type of writing Wenyan Wen (literary language writing) in China and the reformed writing Baihua Wen (plain spoken language writing) in the current society. The intricate relationship between the written language and spoken language has clearly reflected the social, political, and cultural roles attributed to literacy.

Wenyan Wen had dominated Chinese writings ever since Han time, allegedly modeled after the Classic writings of Confucius's times (Chu, 1973). For two millennia, it was the official writing form for all government and court uses, the standard writing format adopted by men of letters, and the expected writing outcome of school educations. While it has multiple characteristics that distinguish it from the current writings (Li, 2011), the main feature relevant for our discussion here, *inter alia*, is its drastic separation from oral language (Mair, 1994). It does so not by adopting a different script as Latin in the case of Medieval Europe, but by using a way of writing, in the same script, that has very little resemblance to spoken language. While it is by no means a static and unchanging way of writing (Li, 2011), its distance from spoken language only grows larger over time. Given the relative quick-paced changes in oral language in terms of phonology, words, phrases, and grammar, Wenyan Wen did not keep up with the changes in new ways of expressions (Cao, 1952/2012), particularly in its continuous use of the main staples of empty (non-substantive) words/characters, archaic prepositions, pronouns, and sentence structures (Li, 2011). It retained its short, mostly single-character words, usually well-balanced four-character phrases, and terse sentences. Due to its distance from oral language, Wenyan Wen always required special and time-consuming training (Cao, 1952/2012). It is in this sense that Wenyan Wen was functioning as an additional layer that complicated the literacy situation in China in addition to the ideographic script and dialectal diversity. It should be pointed out that Wenyan Wen eventually lost its popularity in main-stream Chinese writings and trainings primarily due to this added complication to Chinese literacy acquisition (Zhou, 2009). In fact, it was called a dead "ancient language" when 20th century dawned (Zhou, 2009, p. 13).

The pronounced reason for Wenyan Wen to lose its traditional dominance is the national awareness of its obstruction to the popular literacy promotion and consequently its drag on the national modernization at the beginning of 20th century in China (Hu, 2005). In its stead, emerged Baihua Wen, writing that follows the spoken language (Zhou, Y. 2004). As a conscious counter measure, Baihua Wen allowed the learners to access the spoken language without having to go through the contrived structures and short dated single-character expressions, therefore presumably facilitating reading and writing processes. It should be noted that such shifts to oral language discourses have occurred continually through Chinese history, for example in the newly developed literary genres such as translated Buddhist literary narratives in the Tang time, plays in the Yuan time, and fictions in the Ming time (Cao, 1952/2012). The Baihua Wen promotion at the beginning of the 20th century was just more conscious as a national push for education reform and social and technology reform (Chen, 2014), and consequently replaced Wenyan Wen as the dominant writing for literature, textbooks, and newspapers (Hu, 2005). The solution it offers to deal with the exorbitant time spent to master Wenyan Wen has been obvious, making literacy more available to a broad populace (see Table 4). However, even though Baihua Wen is now the primary written language used in modern China, Wenyan Wen's influence and existence still persist. Not merely texts in Wenyan Wen is part of advanced Chinese curriculum in middle schools and beyond, numerous characters and idiomatic expressions from Wenyan Wen have retained their presence in Baihua Wen. In creative literature writings such as poems and essays, Wenyan Wen has been strongly argued for its existence because of its beauty, elegance, stately forms, and richness of cultural heritage (Chen, 2014; Qi, 1997).

As part of the national discourse about literacy, what Wenyan Wen and Baihua Wen have demonstrated is their historical role in literacy acquisition and literacy application. They show their vitality and traction in Chinese learning and use as tools for different utilities. Baihua Wen provides both a context for making a connection with oral language and a literate mentality of the populace, providing an alternative, though slighted by the learned circles throughout history, to the aloof style of Wenyan Wen, and emerging as a political answer as well as a practical means to dominate the writings when the country needs a new approach to solving its political crisis (Cao, 1952/2012; Lu, 1934/1973). Wenyan Wen, on the other hand, tends to have its own resilience in a national conversation about the utility of cultural heritage and hold its appeal as part of a needed diversity when the society is moving forward (Chen, 2014). In this sense, both are literacy tools with cultural, social, and political implications, called forth to perform their duties beyond mere pedagogical and practical considerations. Their parallel trajectories through history and the eventual succession in dominance in the 20th century, bring out the political, social, cultural, and educational shifts, reminding us again of the intricate relationship among the various functions of literacy.

Literacy acquisition in Chinese: highlighted features and associated research efforts

What stands out most of Chinese literacy acquisition is not that it is different from any alphabetic language acquisition. It requires knowledge of its writing script and its successful applications in readings and writings. But what is different from literacy acquisition of alphabetic languages is also clear: it stems from the nature of its ideographic script, and from how it has traditionally been used in the society and culture. In short, it comes from the unique distance between its writing script and spoken language, between its traditional written language and spoken language, and its social and cultural applications. These differences have been largely contributing to the complex literacy situation in China, and also to a great extent been the driving forces that move both literacy acquisition and research efforts. The literacy education in China tends to show the following features pertaining to overcoming these distances and some deep-rooted social practices.

First, literacy education usually starts with the common language and Pinyin (Zhou, Y. 2004). While the common language is still an acquired skill for many kids due to dialect situations, the widespread TV, radio, and other public media as well as current convenient means of traveling across the country have provided some solid experiential ground for the common language acquisition. Yet, in areas that Putonghua is not popularly used such as Hong Kong, learning Putonghua could be a challenge for children (Tong and Goh, 2008). Properly mastering Putonghua pronunciations should assist Pinyin learning, and in turn help

Table 4 Illustrations of some main differences between Wenyan Wen and Baihua Wen.

	Differences	Wenyan Wen	Samples (meaning or function)	Baihua Wen	Samples (meaning)
Word level	Characters as words	Usually single character words	民2 (people) 虎3 (tiger)	Two or multi-character words	人2民2 (people) 老3虎3 (tiger)
	Main meaning changes	Archaic (not available in modern writing)	微1 (if not) 夫2 (modal word)	Current main meaning (may exist in the past)	微1 小3 (tiny, small) 丈4夫1 (husband)
	Changes of word forms (personal pronouns as examples)	Archaic characters (few still used in modern Baihua Wen writing)	吾, 我, 尔, 余, 台, 朕, 汝, 尔, 若, 乃, 彼, 其, 或, 某, etc.	Limited and mostly different from the archaic ones	我, 你, 您, 他, 她, 它, 我们, 你们, 他们, 她们, 它们, etc.
Phrase level	Formulaic vs. free flow	Four-character phrases	悬象设教 (using embodied images in nature to educate and cultivate people)	Free flow expressions	利用天地的征象来教化民众 (This is a Baihua Wen translation of the Wenyan version)
Sentence level	Formulaic vs. free flow	Parallel sentences and phrases	神莫大于化道, 福莫长于无祸。 (Spiritual cultivation reaches its highest level when a person understands and is one with the Dao; happiness is at its best when a person can keep away from misfortunes)	Free flow expressions	最高的精神修养就是把道融入自身, 最好的幸福就是没有灾祸 (This is a Baihua Wen translation of the Wenyan version)
Grammar	Function words usage (auxiliary words at the end of an interrogative or exclamative sentence)	Plenty of archaic function words (belonging to empty/non-substantive words)	也, 矣, 乎, 诸, 哉, 耳, 焉, 邪, etc.	Limited uses of different function words	吗, 呢, 啊, 呀, etc.
	Complements	Complements can be omitted	民扶老携幼, 迎君 [于] 道中 (people came out with their elders and youngsters on the road to welcome the Lord)	The omitted complement is turned into an adverbial phrase "on" the road.	老百姓搀扶着老人, 携带着孩子, 在路上迎接孟尝君。 (this is a Baihua Wen translation of the Wenyan version)
	Object positions	Could be before verbs	不吾知 (do not know me)	Could not be before verbs	不知道我 (Baihua Wen translation)

NOTE: These characteristics are not absolute nor are they exhaustive. However, their combined effect is quite obvious in all the samples here: oral language-based and therefore lengthy Baihua Wen versus classic written language-based and terse Wenyan Wen.

Numbers in Table 4 designate one of the 4 tones in Mandarin Chinese.

children with early start of reading and writing (Liu, 2005), particularly for children from other dialect zones than that of Mandarin to develop Putonghua-based sensitivity to characters and expressions (Zhang et al., 2000). Second, Chinese text read-aloud has always been a salient practice of literacy acquisition in schools. Such practice is highly promoted in schools to assist the common language mastery, acquisition of the phonological values of characters, and building fluency in connecting writing with oral language (Zhou, 1999). It is also a traditionally endorsed and promoted practice in China (Tao and Zuo, 1997), not merely persisting for more than 2,000 years in Chinese literacy (Chi, 1998), but also is believed to be an effective way to experience the unfamiliar language elements and styles (Zhang, 1997), thereby building foundations for continuous reading at advanced stages where existing Wenyan Wen's proportion increases (Ye, 1980). Almost all texts still contain the requirement for recitation of certain texts as a push for text-familiarity (e.g., Shanghai Elementary and Middle School Textbook Reform Committee, 2000).

Third, based on an ideographic script, Chinese literacy learning has, from its inception, relied on using its available relationship between semantic and phonetic clues in its orthography to learn characters. Research has supported teaching children through exploring radicals in compound characters (Anderson et al., 2013). Such teaching practice hinges on maximizing the semantic categorical information and phonetic approximation information in characters, therefore encouraging analogical as well as reflective approaches to learning. This apparently is not too different from what Xu Sheng did 2,000 years ago with the explications of six principles of character formations (Su, 1997), allowing learners to make use of the structural components of characters to help alleviate the difficulty caused by the oral and written language distances. Indeed, in order to further connect the oral and written language, characters are also learned in meaningful contexts of words and texts, making students aware of the power of characters in forming meaningful words used in modern Chinese. Therefore, scholars recommend teaching characters for their generalization and teaching characters in the context of words and phrases, and the latter in the context of texts (Li, 1997; Tong and Zhang, 1999).

Finally, as writing units that do not bear explicit consistent phonetic symbols in their formation, characters require sufficient practices to be grasped (Si, 1982). For early literacy learners, learning to write characters usually goes along with learning to read characters, starting with tracing characters in the order in which strokes are written. This can help learners to grasp where to position the strokes within a given character in order to write it correctly, and helps with character differentiation and recognition via stroke pattern knowledge (Chen et al., 1996). In addition, knowing how to follow the sequence of strokes could facilitate character writing, not merely in speed as in cursive style writing in English, but also ensuring its procedural accuracy and esthetic presentation (Yin and Wang, 2008). Most of the characters students are required to learn to recognize are also required writing characters: two thousand five hundred characters out of three thousand (China's Department of Education, 2000). Such imitation writing practice is always accompanied by and extended to both formal and informal writing practices (Si, 1982; Zhang et al., 2000), supported by Pinyin use at the very beginning stage of learning (Liu, 2005). In recent times, computers have played an active role in both promoting students' early learning of reading and writing (Liu and Zhang, 2006).

As you may have already gleaned from the above examination of the Chinese written language, efforts, of research or praxis, in literacy acquisition have always been about the nature of the script and how to best bring out the power of the written language in its acquisition. In the history of Chinese literacy development, efforts were expended on simplifying characters from the archaic form to its modern-look characters with its typical straight-lines and regularly squared size no later than in the Warring States periods (475 BC–221 BC) (see Xu, 2009). Precursors to both modern efforts of Pinyin and Putonghua to connect the written language to an oral language had also surfaced then in the form of direct "sound-borrowings" (Cao, 1952/2012) and Yayan (Wilkinson, 1998). The differences between the intent of writing, written language (wen), and oral language (yan) had also been highlighted and debated in Mo Zi and Confucian works (Hu, 2005), projecting an early awareness and sensitivity in the cultural practices of the distances between oral and written language (Tao and Qian, 2012b). When Xu Sheng at around CE 100 came out with the explicit description of "loan characters" as a principle of character-formation (borrowing via sound-similarity), it highlighted the cultural awareness toward that yawning chasm between the written characters and oral language in reality (Xu, 121/1989). The history of Chinese literacy development afterward for about two thousand years has always reflected such understandings of the difference between oral and written expressions, from Han Dynasty's (206 BC–CE 220) application of the clerical character style, Weijin and NanBei Dynasties' (CE 220–581) broad adoption of Qieyun (onset-rime approximation) approach, Tang's (CE 618–907) popular oral style literary narratives, to the modern time efforts in Romanization, character simplification, and Putonghua (Zhou, Y. 2004). While most of these efforts, particularly the ancient ones, are indigenous in origin, they have often been informed by language influence from outside China, such as Sanskrit's influence on Qieyun and Buddhist translation on Tang's popular literary writings (Hu, 2005). As a cautious side note, it should also be added that centralized efforts from top down also seem to have a desired effect on literacy growth only if they are measured and rooted in practices as in the successful promotions of Pinyin, simplified characters and Putonghua. This persisting tension in literacy development created by distance between the oral language and the script, and between the popular but "vulgar" style and exclusive but aloof elite style must have reflected a dynamic vitality of the Chinese language to sustain its own growth by accommodating the input from outside and adjusting itself to meet the needs of social progress (see Huang and Meng, 2001; Yin and Wang, 2008).

The research efforts in the last quarter of the 20th century and first twenty years saw a steady and exciting rise of research into various cognitive, linguistic, and pedagogical aspects of Chinese written language acquisition (See Anderson and Chen, 2013), yielding much needed fine-grained understanding of many processes of Chinese acquisition as our preceding descriptions have shown. The focus of the research is primarily on the role characters play in literacy acquisition, and on the perceived distance between characters and oral expressions, offering insights into the phonological and morphological functions in the orthography of characters. While many areas of this line of research are still being explored, elucidated and discussed, there is no doubt that the current research, following the Western traditions of cognitive and psycholinguistic theories, has provided and continues to provide the necessary insight into our understanding of written languages as well as into pedagogical approaches catering to literacy education in general.

Conclusion: what we know and need to know more

The picture we have painted of Chinese literacy is straightforward. As an ideographic writing system, Chinese script shows its non-alphabetic peculiarities in emphasizing the converging clues from orthography, phonological, and semantic components in character acquisition, highlighting both the utility and accompanying uncertainty of using an opaque approach of analogy in the process. Over its history, the development of the Chinese writing system has reflected writing's relations to its oral language, accentuating the important roles social and political factors play in coordinating the relations. At the same time, it is clear that the ideographic system itself has also been open to efforts both from within and without to make its phonological connections with spoken language. Yet the degree of the phonological transparency in its script is not an absolute measure of its successful acquisition. In retaining its ancient ideographic nature, the Chinese writing system shows its ability to conform but also to persist, making such interventions as Pinyin and Putonghua effective only in the context of its fundamental characteristics and practical precedence.

Yet, many areas of Chinese literacy development and acquisition are still unclear. Two areas that call for research attention are highlighted here. The first is the relationship between literacy acquisition by learners outside Mandarin dialect zones and literacy acquisition by learners of Mandarin. Given the different distances of their oral dialects to the written language, we

would like to understand how and if the literacy acquisition is mediated by the dialects, particularly in the context of a common language. Our knowledge on this is still lacking even though most of the common language efforts and alphabetic push are partially based on the tacit assumptions of the obstructive distance between the oral and written language in dialect zones. Most of the studies on literacy have been done with either Mandarin or Yue dialect students (e.g., McDowell and Lorch, 2008; Xu, 1991; Yip, 2014), shedding some light on character acquisition with specific dialect features. However, systematic studies are still to come with regards to the possible interactions between dialects and the common language for literacy acquisition. A practical question of the dialect situation to literacy acquisition from a developmental angle seems to come naturally from the current parallel push for a common language and dialects, the latter for fear of losing local cultures (Erbaugh, 1995; Ichikawa and Komatsu, 2008). Without understanding how dialects interact with a common language in literacy acquisition, policy-makers' stances on literacy in dialect zones may be more persuaded by political and cultural affiliations than informed by literacy acquisition purpose, having implications both for beginning literacy acquisition in dialect zones and for popular literacy in general.

The second area that needs more attention is that of historical literacy research, including the early Chinese literacy. We have seen some efforts made in such directions (see Li and Branner, 2011; Tao and Reinking, 2020; Wang, 2020) providing some promising and innovative steps taken to explore early Chinese literacy practices. But due to the documents and records limitations pointed out by Li and Branner (2011), studies on literacy's past are still few and far between. Up to now, the most acknowledged studies on ancient Chinese literacy are still Rawski's 1979 *Education and Popular Literacy in Ch'ing China* in English, and Zhang Zhigong's 1964's book (1992 reprint) *On traditional Chinese education and texts with a bibliography of character texts and book reprints* in Chinese. It is obvious that our current knowledge of historical Chinese literacy is far from satisfactory. Of the numerous literacy areas usually explored in the western world (e.g., Heath, 1996; Venezky, 1996), Chinese historical literacy research is still to come. For example, we mentioned briefly some challenges and solutions surrounding the Chinese script development in China's history. But comprehensive studies are needed to examine from a literacy acquisition perspective what historical, linguistic, and socio-cultural factors interacted with the Chinese script to shape its continuous development on an ideographic path in spite of numerous encounters with cultures with alphabetic languages. Such an understanding will not only provide historical insight into a very important piece of literacy history, but would also inform our pedagogical practices and policy-making in current literacy education to cater to the nature of the script as well as to the accompanying social needs.

To conclude, the distances between Chinese written and oral languages will continue to play out in Chinese literacy acquisition and applications. Literacy acquisition and practices will continue to pose new challenges not merely about its writing system, but also raise questions about our theoretical frameworks through which we assess its uniqueness and idiosyncrasy and about our ability to influence its direction. In this sense, literacy acquisition and applications are never simply the uses of a writing system as a tool. They are also the powerful forces behind the vicissitudes of its change and the current form it takes.

Acknowledgments

My sincere thanks to Dr. Gene Fellner, Dr. David Kritt, and Dr. Li Zuo who have provided insightful comments and helpful suggestions to the several drafts and the final version of the current chapter.
